Turell held a Fulbright Visiting Postdoctoral Research position between 1984 and 1985 at the University of Pennsylvania Linguistics Laboratory, directed by William Labov. In her capacity as Professor of English Linguistics since 1986 and also as head of research group UVAL (Unitat de Variació Lingüística – www.iula.upf.edu/uval) in several Spanish universities—Universitat de Barcelona, Universitat Rovira i Virgili, and Universitat Pompeu Fabra—since the mid-1980s, at the turn of the 21st century Turell is conducting and supervising research both on linguistic variation within the speech community and on intra-speaker/writer and inter-speaker/writer variation in apparent and real time and across different textual genres, thus contributing to the task of measuring and describing an individual's idiolectal style, which still seems an unattainable goal for modern forensic linguistics, particularly in the area of authorship attribution. Since 2003 she has been the director of ForensicLab (www.iula.upf.edu/forensiclab), the forensic linguistics laboratory at Institut Universitari de Lingüística Aplicada, where she has been promoting teaching, research, and expert witness activities in this field. She is the academic director of the first master's degree offered in Spanish around the world (Master en Lingüística Forense IDEC-IULA: www.idec.upf.edu/master-en-linguistica-forense-espanol), which started in 2007–8.

Turell is the principal investigator of two funded research projects on forensic idiolectometry (MEC-HUM 2007-29140-E and MCI-FFI 2008-03593-FILO: www.iula.upf.edu/rec/ideolec/index_eng.htm), the results of which have contributed to introducing validity (internal and external) and reliability in the forensic comparative analysis of real-world texts and texts derived from real forensic cases. She has supervised two PhD dissertations in forensic phonetics (Cicres Bosch, 2007 <http://www.tdx.cat/TDX-0411108-101619/>; López

Escobedo, 2011) and one in forensic authorship attribution (Spasova, 2009), and is also promoting and supervising research in other forensic linguistic areas such as deception in police interviews within the common law system, police interrogation in Spain, sexual child abuse, and trademark litigation. Results from this research are directly integrated within the teaching activities and expert witness performance of the staff members of ForensicLab.

Professor Turell's qualifications—BA honors in English language and literature (Universitat de Barcelona, 1973), MA in linguistics and ELT (University of Leeds, 1975), PhD in Catalan philology (Universitat de Barcelona, 1981), MA in forensic linguistics (Universitat Pompeu Fabra, 2008)—guarantee quality performance in her consultancy work as a forensic linguistic expert. She takes consultancy work for texts written in Spanish, Catalan, English, and French. Turell has provided linguistic evidence for more than 15 years and has been involved in more than 40 criminal and civil cases in Spain, Peru, and the United States. She specializes in (a) detection of plagiarism (between texts written in Spanish or Catalan and between Catalan or Spanish translations of an original text written in English or French); (b) forensic text comparison leading to more reliable decisions in authorship attribution; (c) semantic interpretation of ambiguous legal texts; and (d) trademark litigation. She has worked on many different forms of written texts, both in Spanish and Catalan: short texts, such as e-mails and faxes, and anonymous letters; medium-size texts such as informative reports in nonspecialized magazines; and longer texts such as terrorist conspiracy documents, as well as textbooks. In all cases where it is possible, she applies both qualitative and quantitative statistical analyses to ensure reliability and internal and external validity of results.

She has lectured extensively on all these forensic linguistic areas in Spain and the United Kingdom. Results from Turell's research and activity as a forensic linguistics researcher and expert have appeared in the *International Journal of Speech, Language and the Law* (Turell, 2004, 2010), and other journals (2007b, 2008b) and collected volumes (Turell, 2005b, 2008c; Spasova & Turell, 2007; Turell, Cicres, & Spasova, 2007; Gibbons & Turell, 2008). In collaboration with Teresa Castiñeira she is preparing an article entitled "Issues Facing a Multilingual Legal System: Two Systems, Two Languages in Catalonia?" She is also preparing two more books: *Language and Law Across Judicial Systems*, to be submitted to the Oxford University Press *Language and Law* series, and a popular introduction to forensic linguistics, coauthored with John Gibbons, which will be entitled *Delatados por el Lenguaje*.

M. Teresa Turell is a member of the Advisory Board of the Oxford University Press *Language and Law* series and elect vice-president of the International Association of Forensic Linguists (IAFL). In 2009, the Forensic Linguistics Laboratory, ForensicLab, whose director is Professor Turell, received the 2009 Knowledge Transfer Award from the Universitat Pompeu Fabra Board of Trustees.

Typology and Second Language Acquisition

ANNA GIACALONE RAMAT

The Relationship Between the Typological Approach and Second Language Acquisition

In recent years increasing emphasis on typological research has triggered a growing interest in the implications of typological findings on second language acquisition (SLA). The typological approach is relevant to acquisitional studies in (at least) two respects. The first of these is the crucial role of comparative methodology: the process of learning a second language involves a structural and functional comparison of the two linguistic types. Typological distance can be correlated to learning difficulties and learning pace; indeed, the presence of two different systems in the learner's mind is in all respects a contact situation at the individual level. Second, learner languages (or interlanguages) are a subset of human languages and as such a source of validation for typological universals. The implications of the typological approach have been scarcely recognized in the literature; however, this point was clearly stated by Greenberg (1991, p. 39): "one may say that universals apply equally to interlanguage and to primary language."

Typological universals are inductive generalizations about features of human languages, they are not innate properties of the human mind. This means that in typology first language is not the privileged focus for studying human linguistic capacity, as it is in generative linguistics; also, second languages contribute to research into the nature of language and help us to understand the structure and functions of human languages. In general, however, the relation between typology and SLA has been considered an unequal one, with typology as the source of hypotheses for studies of SLA. This idea has nowadays been replaced by a more balanced approach in which the role of SLA research is not limited to providing empirical data, but can contribute to revealing or refining the organization of universal properties (Comrie, 1984; Giacalone Ramat, 2003a). Moreover, as suggested by Comrie, language universals "lend themselves to ready transposition into predictions about ease of acquisition." The image of "cross currents" between typology and SLA research suggested by Huebner and Ferguson (1991) provides a template for actual and future research.

Functional Typology: Some Concepts and Their Implications for SLA

Functional typology aims to formulate constraints upon variation for a broad range of phenomena. Since the early days when the emphasis was on structural classification of types across languages during the nineteenth and twentieth centuries, typological studies have turned to the search for crosslinguistic generalizations (language universals) based on representative surveys of languages (Greenberg, 1966). Universals of language can be subdivided into *substantive universals* and *formal universals*. Substantive universals may be *absolute* (such as the universals that all languages have consonants, vowels, nouns, and

2 TYPOLOGY AND SECOND LANGUAGE ACQUISITION

verbs) or *implicational* (relating the presence of one grammatical property to the presence of some other property)—for example, if a language has first-/second-person reflexives, then it will have third-person reflexives (Comrie, 1989, p. 17).

Typological universals may have exceptions: this means that they are not absolute, but indicate tendencies (this fact does not diminish their validity, although absolute universals would be stronger). Word-order patterns, in particular the order of the major constituents of the clause, are typically formulated as statistical generalizations (“with more than chance frequency” to use Greenberg’s expression): they are “statements of limitations on cross-language variation” (Comrie, 1989, p. 94). Universals in the typological approach thus contrast with universals in the formal generative approach as being inductive rather than deductive and part of innate linguistic ability. A survey of typologically relevant phonological and grammatical structures in the languages of the world is provided by *WALS* (Haspelmath, Dryer, Gil, & Comrie, 2005).

One of the earliest studies on typological universals that found an application in second language acquisition was the noun-phrase accessibility hierarchy for relative clause formation (Keenan & Comrie, 1977). The hypothesis was that learners of a second language would find it easier to acquire relativization on elements higher on the hierarchy (subjects and direct objects) than on elements lower on the hierarchy (oblique objects, possessors). While earlier work on native-speaker usage and SLA has largely borne out the predicted order, further studies have revealed a number of constructions in which the syntactic constraints between the relative clause and the main clause have been loosened to obtain a general noun-modifying clause. Furthermore, crosslinguistic study of relative clauses has pointed to considerable variation among the strategies adopted for specific positions on the hierarchy. Different strategies were found not only across different languages, but also at different levels of the same language (oral versus written, informal versus formal speech); substandard varieties of Romance as well as Germanic languages have revealed the use of different strategies with respect to standard varieties: pronoun retention, invariable markers, gapping, and the influence of various semantic and pragmatic factors.

Relative clauses in learner languages share structural similarities with findings from typological research: both strategies of juxtaposition and the use of invariable markers for all positions on the accessibility hierarchy are documented (though in fact relativized positions are mostly limited to subject and object). Consider the following examples from early learners of L2 Italian (Giacalone Ramat, 1999):

prendi mio eh una dialio io eh porto cinese
take-2SG my a journal I take 1SG chinese
'I would take with me a journal (that) I brought from China' (CH, L1 Chinese)

c'è un mio amico- lui si chiama ehm Lo/Lorenzo eh lui abita Greisietto
there is a my friend him is called Lorenzo him lives G.
'There is a friend of mine whose name is Lorenzo, who lives in G'. (MK, L1 Tigrinya)

The second example shows a kind of presentational construction of the type pointed out by Givón (1990, p. 655) in which the use of anaphoric pronouns represents a paratactic strategy of clause connection, also common in pidgins.

Hawkins (1987) has discussed predictions for the order of acquisition and expected types of learners’ errors derived from implicational universals, while Hawkins (1999) introduced a performance perspective based on processing considerations to account for the distribution of relative clause patterns. Other correlations between typological generalizations and developmental patterns in L2 acquisition are provided by an analysis of the emergence of indefinite pronouns among L2 Italian learners (Bernini, 2003) according to the predictions of language typology.

It has been noted that learner languages lack morphological distinctions, irrespective of whether or not the source language or the target language are rich in morphology (Giacalone Ramat, 2009). The growth of morphology in learner languages partially reflects universal principles suggested by functional typology such as markedness principles.

External explanations for implicational universals, based on features outside grammatical structure, can be found at the cognitive, psychological, and pragmatic levels: it has been suggested that the reason why the subject position is the position available in all languages for relative clause formation is to do with ease of processing, as independently shown by acquisitional data (Keenan & Comrie, 1977).

The Role of Markedness

The concept of markedness, taken from the Prague school and adapted by Greenberg (1966) to crosslinguistic universals, essentially concerns a set of asymmetries characterizing pairs of linguistic elements. For example, according to structural markedness criteria, the marked member of a category will be expressed by at least as many morphemes as the unmarked member of the same category. A typical case would be the English plural marker *-s* in front of the zero singular (Croft, 2003). Typological markedness criteria exclude the type with marked singular and zero plural (this pattern is rare indeed: it is found e.g., in feminine nouns in several North Italian dialects: *la skara* 'the staircase'/ *i skar* 'the stairs'). Leaving aside the whole set of markedness criteria, what is interesting from the acquisition perspective is that in linguistic oppositions the unmarked member of an opposition is favored over the marked one at all levels. Thus, markedness criteria lend themselves to predict ease and/or difficulty in L2 acquisition.

Frequency is a correlate of markedness: the unmarked member of an opposition is more frequent in language use (and also across languages—e.g., the singular is more frequent than the plural). Frequency of patterns in the input affects first language acquisition (Tomasello, 2003); although there are fewer studies on SLA, it is reasonable to expect that frequency might play a role (see Ellis 2002, p. 143).

Typological markedness and frequency may predict both language change and acquisition: the most frequently used words in a language undergo grammaticalization processes, may be abbreviated, and even substituted: the cycle of *pas* negation in French from Latin *passum* 'step' to the negative construction *ne . . . pas*, reduced to *pas* in the spoken language, is a case in point.

The effect of typological markedness on acquisition may be illustrated by the development of gerunds in L2 Italian (Giacalone Ramat, 2003a). On the one hand, in native Italian, gerunds as a means of adverbial subordination are more marked than finite forms; on the other hand, in the acquisition of Italian, the different functions of gerunds emerge according to a developmental sequence that can be read as a markedness scale, with the progressive periphrasis *stare*+gerund as the least marked construction followed along the scale by predicate gerunds and sentence gerunds as the most marked constructions.

The notion of typological prototypes is based on a view of categories defined in terms of core or central members and peripheral members. The analysis of prototypical transitive constructions as a cluster of features such as the presence of two participants, one agentive and volitional the other affected (Hopper & Thompson, 1980) is a clear example of the prototypical approach. In the acquisitional perspective, prototypical meanings for grammatical categories are expected to be acquired earlier than nonprototypical meanings because they are more accessible in that they require less elaboration by the mind (Taylor, 2008). In typological research, Dahl (1985) has argued for a past time prototype in the languages of the world that would associate past temporal reference, telic actionality, and perfective aspect. There is wide literature confirming that learners preferably associate past

grammatical markers to telic verbs that match the prototypical associations such as “break” or “find” (Andersen & Shirai, 1996). Although the prototypical approach has proved to be a useful tool in understanding the genesis and development of temporal and aspectual categories in learner languages, more research is needed on the interaction of various factors which contribute to the patterns observed. The so-called “primacy of (inherent) aspect” leaves many questions unanswered, particularly as to the origin of actional categories and whether they belong to learners’ innate equipment or are acquired by children and adults on the basis of linguistic experience. According to recent research (Giacalone Ramat & Rastelli, 2008), prototypes in the area of predicate actionality would not belong to innate endowment, but have to be learned in the course of acquisition, taking into account the morphological and semantic environment of lexical predicates. Learners seem to grasp the actional content of predicates tentatively using a compositional approach.

Motivations for Typological Universals and Language Acquisition

One of the central aspects in typological studies is the search for motivations for observed synchronic crosslinguistic patterns. The competing motivations model has provided “an important class of explanations for both typological variation and constraints on that variation” (Croft, 2003, p. 64). The two main functional motivations are the economic motivation (the principle that the most frequently used expressions should be coded by means of the lowest number of morphemes) and the iconic motivation (maintaining that the structure of language should reflect the conceptual structure or the semantic structure as closely as possible). The economic motivation is reflected in markedness theory (unmarked forms are usually the shortest morphologically). Explanations in terms of economy are likely to be correlated to highest text frequency. An application of the iconic principle was proposed by Givón (1990, p. 826) as the “binding principle” governing the degree of grammatical integration of a complement clause with its main clause on the basis of the degree of control exerted by the main clause agent over the realization of the event or state of affairs in the complement clause. Evidence for the role of this iconic principle in acquisition comes from the development of clause-combining strategies in L2 Italian: modal predicates and phrasal predicates are regularly followed by reduced (or “deranked”) infinitive forms, as predicted by Givón’s iconic principle, while utterance predicates which entail a weak semantic integration with their complement clause are mostly followed by finite verbs in the complement clause (Giacalone Ramat, 1999). Furthermore, infinitive predicates depending on modal verbs emerge among the first attempts by learners to combine two predicates.

The general one-to-one principle (or “isomorphism” between meaning and grammatical form) is another iconic principle adhered to in acquisition. Although some violations have been reported, learners strive toward transparent diagrammatic relationships between form and meaning. In the acquisition of tense and aspect, for example, the tendency “from implicit to explicit” has often been pointed out: after a very early phase in which tense features are left unexpressed because of lack of grammatical knowledge, learners gradually develop tense marking in order to make temporal relations explicit (Dietrich, Klein, & Noyau, 1995). The effect of iconic motivation has also been recognized in word order, where it may give rise to patterns of competing motivations. As noted by Haiman (1985, pp. 237–8) the principle that “old information comes first in an utterance” would assign focus to the last element, while the principle of “what is uppermost in the speaker’s mind tends to be first expressed” assigns focus to the first element. A further iconic principle frequently attested in learners’ utterances is that of natural order, stating that the order of

mention of different events mirrors the order of occurrence; this principle in more advanced or native varieties may be overridden by syntactic devices.

As discussed above, competing motivation models can account for variation in language types, since no one language type is ideal, i.e., wholly motivated, because of competition among different principles governing the existence of language types. In addition, it has turned out that competing motivation analyses may contribute to a better understanding of developmental processes in acquisition.

The Issue of Transfer

A crucial factor in language acquisition is the role of the source language. Although there is no doubt that transfer influences learners' approach to a second language in subtle and complex ways, as the abundant literature has shown, we will be only concerned here with the interaction of typological universals and source-language structures.

In their study of two bilingual children exposed to Cantonese and English, Matthews and Yip (2003) provide a case to assess the weight of the dominant Cantonese language, in spite of the marked status of Cantonese prenominal relative clauses. The transfer of prenominal relative clauses to the children's English, triggered by external factors (the dominance of Cantonese in the children's environment) overrides the children's tendency to initially assume unmarked options. A subsequent stage in the children's bilingual development revealed the production of postnominal relative clauses with resumptive pronouns, a development that instantiates a universal strategy and as such an option universally available to language learners. Adduced motivations for transfer are external factors and there are structural similarities between prenominal object relatives and main clause word order.

This case shows that the children's early bilingual development may reflect a combination of both transfer and universal processes.

Some Further Relevant Topics on Second Language Research

Work on the impact of typological parameters on second language research has revealed some as yet unexplored aspects of the development of L2 competence. Needless to say, language acquisition is a far more complex process that involves several factors beyond typological findings. Other studies of interlanguages have addressed specific aspects of the acquisition process, e.g., they have aimed at the definition of developmental stages for diverse structures, such as negation, interrogative clauses, or the order of development of the grammatical means of temporal reference (see Pienemann, 1998, and for L2 Italian Giacalone Ramat, 2003b).

Analyses of naturalistic (or spontaneous) L2 learners have been highly influential in European and American linguistics, showing the emergence of grammar along paths that involve mechanisms and principles based on cognition, language use, and perception.

Learner languages are gradually built taking advantage of iconicity and economy principles; they also show the operation of some semantic and pragmatic principles that determine the form (and in particular the order of constituents) of learner utterances. The pragmatic principle of placing the focus last in the utterance (*focus last*) and the semantic principle of placing the NP with the most control first (*controller first*) govern the structure of the utterance at an initial stage, but can come into conflict in some discourse contexts, with one of them being overridden. Such conflicts have been identified as the motivating factors for the further development of interlanguages toward the target language. It has also been claimed that language learners universally develop a simple but efficient form

of language called the “basic variety” whose organizational constraints belong to the core attribute of the human language capacity (Klein & Perdue, 1997).

Recent work within SLA research has focused on usage-based models for investigating the emergence of systematic patterns in first *and* second language acquisition (Tomasello, 2003; Goldberg, 2006). Several studies have also underlined the role and impact of perception (mirrored in saliency), of processing abilities, of the input, and of discourse pragmatics in the development of child and adult language acquisition. While such approaches have become increasingly influential in the study of acquisition, the goal of this entry has been to illustrate the insights provided by typological studies on acquisition and also to sketch a synthesis of current work that shows how second language data can help to provide a better understanding of typological universals in their interaction with specific conditions of language production.

UNESCO and Language Policy and Planning

CLINTON ROBINSON AND GABRIELLE HOGAN-BRUN

The United Nations Educational, Scientific, and Cultural Organization (UNESCO) is the specialized agency of the UN system that carries the flag globally for the human and intangible aspects of society and development. Founded in London in 1945 during the aftermath of World War II, its charter (UNESCO, 1945) emphasizes the importance of knowledge, values, and attitudes in the conduct of human affairs. The opening words of the charter have an abiding relevance: “*since wars begin in the minds of men, it is in the minds of men that the defence of peace must be constructed.*” The underlying concern for peace, respect, dignity, and diversity continues to inspire its global work and leadership role—a concern within which language occupies a critical place.

UNESCO defines its role in part as a clearing-house and a laboratory of ideas, and it is from these perspectives that the organization addresses questions of language. If, as Ager (2001, p. 5) asserts, language planning is the way in which “organised communities . . . attempt to influence the language(s) their members use,” and language policy is “official planning carried out by those in political authority,” then UNESCO has to be seen as exercising an upstream function. Given its international and intergovernmental nature, it has no direct impact on language use nor on official planning—its influence is indirect and can best be characterized as shaping the policy environment. Thus, UNESCO has influence in the context of establishing guiding principles and seeking consensus among its 193 member states. From UNESCO’s point of view, it is the latter which determine policy and implement planning. UNESCO addresses issues of language policy and planning in the areas of culture, education, science, and communication.

From the perspective of culture, UNESCO sets language in the context of “intangible heritage” and of cultural diversity. Defining “intangible heritage” as the “representations, expressions, knowledge . . . that communities, groups . . . recognize as part of their cultural heritage” and as that which “provides . . . a sense of identity” (UNESCO, 2003a, p. 2), language is listed as a “vehicle of the intangible cultural heritage.” UNESCO developed in 2003 a Convention for the Safeguarding of the Intangible Cultural Heritage, a normative instrument whose application in member states is monitored on a regular basis. In terms of UNESCO’s programs, this convention has given prominence to action on endangered languages with the elaboration of criteria of endangerment and the development of an online interactive *Atlas of Endangered Languages* (Moseley, 2010; the online version is available at <http://www.unesco.org/culture/languages-atlas/>).

Through these initiatives, UNESCO works to improve policies not only to preserve the world’s languages in terms of documenting them before they disappear, but also to promote their greater use in social domains (UNESCO, 2009). The focus on languages that are endangered has left a gap in UNESCO’s attention to indigenous and minority languages that, while not currently in danger of disappearing, are nevertheless under long-term threat. In principle, UNESCO addresses this through a further normative instrument, the Convention on the Protection and Promotion of the Diversity of Cultural Expression (UNESCO, 2005, p. 5). Clearly, this has potential implications for policies on language—all

the more so since the convention stresses the importance of protecting the cultural expressions of “minorities and indigenous peoples” (UNESCO, 2005, p. 7). However, language as such is not mentioned in the convention, even though its emphasis on “diversity of cultural expression” implies a concern for the linguistic dimension.

However, in line with its human rights principles UNESCO produced two important instruments, the 1978 Declaration of Race and Racial Prejudice, which challenges linguistic discrimination, and the 2002 Declaration of Cultural Diversity, which especially links questions of cultural diversity with human rights. Advocating policies of cultural pluralism (in Article 2), it calls for policies that encourage inclusion and participation for all citizens to foster social cohesion in our increasingly diverse societies. It contains an action plan committing participating parties to cooperation on objectives which include language-related issues. UNESCO is now developing a coordinated cross-sectoral approach linking migration, integration, and language policies (see De Guchteneire & Pecoud, 2009).

At the heart of UNESCO’s mandate to fulfill the right of every person to a basic education of quality is a concern for access, and determining the language of education has been a key question since its foundation. In 1953, UNESCO espoused the position that “every effort should be made to provide education in the mother tongue” (UNESCO, 1953, pp. 47–8), and it has maintained a consistent stance since then. Fifty years later, an education position paper reiterated the same principles: “UNESCO supports mother tongue instruction as a means of improving educational quality” (UNESCO, 2003b, pp. 30–1). The 2003 document elaborates further principles of bilingual and multilingual education, and of language learning as an aspect of intercultural education. The Education for All Global Monitoring Report, published by UNESCO annually since 2002, has consistently called for language policies which give maximum access to educational opportunity by using the first language of the child. In its 2010 edition, the report identifies language as a cause of marginalization from education, particularly for ethnic minorities, and calls for the “development of intercultural and bilingual education” as a priority to improve access and quality (UNESCO, 2010, p. 273).

In parallel to its focus on language as a vehicle of intangible cultural heritage, UNESCO also supports policies which promote indigenous languages as vectors in discovering and describing indigenous knowledge systems. In aiming to demonstrate the necessity of using local languages as a means of accessing those systems the organization promotes languages in the process of documenting examples of indigenous knowledge systems. The implications for language planning and policy, while made explicit by UNESCO, need to be presented through advocacy on a larger scale. Language is also a factor in UNESCO’s exploration of the links between biological and cultural diversity, with an emphasis on promoting policies that give respect and full value to local perceptions and linguistic categorizations of the natural environment (UNESCO, 2008).

In terms of communication, UNESCO focuses on supporting policies promoting multilingualism in the electronic media, or cyberspace. The pertinent resolution (UNESCO, 2003c) calls for multilingual approaches to both content and operating systems, specifically to

promote human interaction on the Internet by encouraging the creation and processing of, and access to, educational, cultural and scientific content in digital form, so as to ensure that all cultures can express themselves and have access to cyberspace in all languages, including indigenous ones. (2003c, p. 6)

The emphasis on indigenous languages echoes UNESCO’s concern in culture, education, and science to ensure that smaller population groups who are distinguished by language have the same rights and opportunities as others. However, while the principle is well

established and regularly articulated, it does not necessarily mean that the policies of national governments move strongly in that direction.

As a way of giving coherence to its own action in these various areas of language policy and planning, UNESCO operates an intersectoral platform on languages, one of whose projects in 2010–11 is to develop a language policy toolkit with the aim of assisting governments to develop policies that integrate the interconnections between education, media, cultural diversity, language endangerment, and other relevant domains, recognizing that policies in one area have implications in another.

UNESCO's impact on language policy and planning is indirect. What does it depend on? On one hand, the research and pilot projects provide an evidence base on which member states can more confidently design policies, and on the other, impact will depend on the vigor and determination with which UNESCO communicates the collective perspective it represents. In a world where linguistic diversity is under threat from various globalizing tendencies, UNESCO's role in highlighting the need for inclusive policies respectful of diversity is ever more essential.

UNESCO's unique mandate within the UN system places it in a position to remind its member states and the world at large of the significance of the human dimension of collective endeavors—learning and education, culture, communication, and science. Language is both a means and a symbol of development in these areas, and UNESCO's global leadership on language issues will continue to be of crucial importance.

Universal Grammar and Second Language Acquisition

TERESA PARODI

This entry will introduce universal grammar (UG) with respect to second language (L2) acquisition. It will first deal with the notion of UG and how it works in the adult language and in the acquisition of the first language (L1) before turning to the acquisition of an L2.

General Points

The UG framework takes a cognitive approach to language. A grammar is understood as the knowledge we have of our own language (“of” the language, not “about” it; for example, speakers of a language are able to produce a negated utterance, even if they cannot explain the linguistic process leading to it). This knowledge allows us to produce and to understand utterances in this language. It also allows us to identify sounds, words, sentences, and combinations of them that are part of this language or are not.

Native speakers know not only what expressions mean, but also whether the form of a given expression is or is not consistent with the grammar of their language. And it is here that UG plays a role. UG is assumed to be part of the innate language faculty. The role of UG is to determine in advance what is or is not a possible grammar. UG provides an inventory of possible grammatical categories (e.g., nouns, verbs, plural, or tense as both morphological and semantic categories) as well as an inventory of possible grammatical operations; that is, it determines the way in which grammars can function. Some aspects of language hold across languages (so-called principles of UG); others are language specific. Language variation is not random: Languages do not form questions following linear ordering rules of the type “the question word should be the third word in the interrogative clause,” which would yield *did Taroo what eat?* as well as *did your what friend eat?* Languages vary along certain lines, known as parameters of language variation. For example, all languages have question words, but their distribution varies: They can appear in the position where non-question words appear in declarative clauses, as in the Japanese sentences of (1), or in a position at the edge of the clause, as in the English sentence (2).

- (1) a. Taroo-wa *keiki-o* tabemasita
Taroo-top cake-acc ate
- b. Taroo-wa *nani-o* tabemasita-ka
Taroo-top what-acc ate?
- (2) *What* did Taroo eat?

UG in L1 Acquisition

Before getting into L2 acquisition it is helpful to have a brief look at how UG works in L1 acquisition, focusing in particular on the initial state, the developmental process, and the

DOI: 10.1002/9781405198431.wbeal1235

end state. The last is clear: The outcome of L1 acquisition is inevitably the adult version of that particular language. How do children get there? The obvious answer is that children learn their L1 through exposure to linguistic experience: Children need to be exposed to their L1 and receive sufficient input. However, the linguistic data children are exposed to are both under- and over-informative. They are under-informative in that not all possible words, forms, and expressions will be represented in what children hear. Absence from the input could mean either that that expression has just not occurred by chance or that the expression is impossible in that particular language: Children are able to identify those expressions that belong to the latter set, and to establish some kinds of grammatical knowledge, in spite of the fact that the input is under-informative. An example is the identification of possible antecedents for anaphors like *himself*, as in example (3). In this case there are two participants, *Tom* and *Max*; *himself* could in principle refer to either of them, but in English it can only apply to *Max*.

- (3) Tom said that Max hit himself.

On the other hand the input may be potentially misleading about the target language, as it may contain false starts, repetitions, speech errors, and so forth (over-informative input). UG mitigates the effects of the under- and over-informative input (*poverty of the stimulus*) by offering a framework of categories and operations that constrain the search or hypothesis space within which grammatical representations are formulated and, thus, guiding both interpretation and production. The initial state in L1 acquisition is, then, UG paired with exposure to linguistic experience. UG guides development, so that the child's grammar is at all stages a possible human grammar, as opposed to a wild collection of words without any particular organization or organized according to individual rules, which would make the child unintelligible for everyone else. UG guidance accounts for the fast rate of acquisition and for the similarity of developmental stages across individuals learning the same language and across different languages.

UG in L2 Acquisition

If we now turn to L2 acquisition, the central question is whether in this case the acquisition process is guided by UG as the acquisition of the L1 is. What would be the evidence? We can compare with the acquisition of the L1 and its initial, intermediate and final stages.

Given the end point in the acquisition of the L1, the most straightforward evidence would be if learners would achieve in the L2 a level of proficiency equivalent to that of a native speaker of that language. Arguably, most speakers of an L2 do not become native-like. This in itself, however, does not exclude the possibility that UG is constraining the process: Recall that children acquiring their L1 go through stages that are different from the adult grammar but, as said above, each of them represents a natural grammar. The same could apply to developmental stages of L2 grammars. We will explore this in what follows.

With respect to the initial stage, recall that for the L1 the assumption is that the initial stage consists of UG plus exposure to data of the relevant language. Learners of an L2 by definition already have an L1, which represents UG as it is instantiated in that particular language. But L2 learners will need to go beyond that instantiation toward the L2 target: Transfer from the L1 alone will not do. They need to acquire phenomena which are not part of the L1. And the question which arises here is: If the L1 is constrained by UG, will these constraints also hold in the L2?

Does UG Constrain the Development in the L2?

This question was at the center of the debate about UG access in the 1980s (White, 1985; Clahsen & Muysken, 1986, 1989; Bley-Vroman, Felix, & Ioup, 1988). Specifically the question was whether it is possible to construct a grammar beyond that of the L1. As such, it is directly related to that of parameter (re)setting: Is it possible to modify the parametric specification of one's own language? Is the outcome a natural grammar or a "wild" one?

L2 learners, particularly at early developmental stages, show effects of transfer from the L1. For example, speakers of Chinese, a language without articles, leave out articles in English, a language in which they are obligatory. Initially transfer effects were taken as evidence against the involvement of UG in L2 acquisition (no UG access; Clahsen & Muysken, 1986). Later it was acknowledged that, as the L1 is UG constrained, whatever is transferred from it must by definition also be UG constrained (indirect access to UG; Clahsen & Muysken, 1989).

But is UG actively constraining the L2 beyond what is instantiated in the L1? Are the production and comprehension of structures and phenomena not attested in the L1 also constrained by UG?

Evidence of UG Constraints in the L2

Evidence of UG constraints in the L2 are in the first place the *systematicity of the interlanguage* and, furthermore, a systematicity which *represents a possible human grammar*.

Learners make "errors": they produce or understand language in ways which diverge from that of native speakers. But, as first claimed by Selinker (1972), learners' errors are systematic, which points to a rule-based system. This is Selinker's idea of an interlanguage, a grammatical system in its own right, as opposed to "habits" taken over from the L1 (contrastive analysis hypothesis; Lado, 1957) or a random collection of "errors." The study of L2 in the UG framework adopts the basic idea of interlanguage (Selinker, 1972): Errors are systematic, which indicates that the system is rule based.

Assuming, then, that interlanguage is rule based, the question arises whether interlanguage representations are also *possible* human grammars, an instance of a *possible* natural language.

Are L2 Grammars Possible Natural Language Grammars?

Clustering of Morphological and Syntactic Properties

One way of answering this question is by observing specific phenomena in an L2 and testing whether they are compatible with a UG analysis. There are numerous examples of studies with this focus. A straightforward case is the clustering of morphological and syntactic indications of finiteness on the verb. Finite verbs are marked for agreement, tense, or both, depending on language-specific properties. Finite and nonfinite verbs have different distributions in the sentence. This is clearly visible in English (or German or French) in that finite verbs, marked for person agreement and tense, precede negation, while nonfinite ones follow negation. See (4a–c).

- (4) a. Kim has *not* seen Robin *English*
 finite nonfinite
 b. Kim hat Robin *nicht* gesehen *German*
 finite nonfinite
 c. Kim a *pas* vu Robin *Colloquial French*
 finite nonfinite

Children learning their L1 have been observed to be very accurate very early with the clustering of morphological and syntactic markings: Verbs marked for tense and agreement do not occur in the slot for nonfinite verbs (Clahsen, 1988; Pierce, 1989; Meisel, 1994; among many others). Negation consistently follows finite verbs and precedes nonfinite ones, as in the French examples (5a–b):

- | | | | |
|--------|--|----|---|
| (5) a. | marche <i>pas</i>
walk.3sg not
's/he doesn't walk' | b. | <i>pas</i> casser
not break.infinitive
'don't break (it)' |
|--------|--|----|---|

It is less clear how this clustering works in L2 acquisition. One of the reasons for this is the fact that L2 learners, particularly adult learners, have lasting problems with bound morphology (e.g., realization of affixes), which, in turn, makes it difficult to distinguish finite and nonfinite verbs. Some authors (Clahsen & Muysken, 1986, 1989; Meisel, 1991, 1997) claim that the clustering does not exist in L2 acquisition, a fundamental difference with L1 acquisition. According to these authors L2 learners fail to mark agreement and tense consistently and the distribution of negation follows semantic, rather than syntactic, criteria. Their observations are based on the fact that in L2, German verbs which according to the context should be finite lack the morphological marking and, in some cases, occur with the wrong distribution. An example would be (6), produced by a speaker of Italian (Clahsen, Meisel, & Pienemann, 1983), the German equivalent of *I no buy*, where the negation immediately precedes the verb to which it applies; this distribution is, however, incorrect in a finite context. According to the authors mentioned, the learners follow a strategy based on linear order and semantics, rather than structural criteria. This, in turn, means that any grammatical knowledge in the L2 is drawn from the L1; given that the L1 is assumed to be constrained by UG, this constraint applies also to the L2 in cases of transfer from the L1.

- (6) ich *nein* kauf
I no buy.root
Target: 'ich kaufe nicht, ich habe nicht gekauft'

A different interpretation of these data is offered by Parodi (2000), who observes that the omission of morphological markings affects a subset of verbs, namely, full lexical verbs (or "thematic" verbs). Modals, auxiliaries, copula *be*, and possessive *have* ("non-thematic" verbs), on the other hand, display correct subject–verb agreement in over 90% of the contexts over a two-year period. Crucially, these verbs also occur with the expected distribution for finite verbs, that is, to the left of negation as in example (7). This is in striking contrast to thematic verbs, with a rate of 59% of correct agreement and a fluctuating distribution. In other words, the clustering of morphological and syntactic properties does hold, but is initially limited to the subset of non-thematic verbs, and extends to thematic verbs in the course of development.

- (7) aber er hat *nich* die papier
but he have.3sg not the papers
'but he has no documents'

Other authors (Lardiere, 2000; Prévost & White, 2000) acknowledge the omission of tense and agreement markings, but claim that the distribution of verb forms is still not random. Their claim is that verbs which show the morphological marking never occur with the wrong distribution. According to these authors this indicates that syntactic constraints are operating in the interlanguage.

These examples illustrate how researchers compare L1 and L2 acquisition asking to what extent UG constrains the latter; that is, whether the interlanguage is a possible human grammar.

Poverty of the Stimulus Effects

Schwartz and Sprouse (2000), however, observe that UG-compatible analyses of interlanguage data may become obsolete if the theory they are formulated in evolves. These authors point out that for this reason, possibly the best way of clarifying the role of UG in L2 is by focusing on effects of poverty of the stimulus, that is, properties which are not part of the L1 and which are underdetermined in the L2 input. Poverty of the stimulus effects can be evident in the speakers' knowledge of grammaticality and ungrammaticality: Native speakers know which expressions (sounds, words, sentences) are part of their grammar or not, that is, which expressions are "grammatical" in their system. For example, a speaker of English knows that while (8a) is possible in certain registers, (8b) is not. In technical terms we would say that, although subjects are obligatory in English, they can be left out in a colloquial context (8a). Omitting the subject, however, is impossible in an embedded clause (8b).

- (8) a. _ seems that it's raining
b. it seems that _ is raining

Poverty of the Stimulus in the Syntax

In the L2 acquisition literature there are many studies which address the question of grammaticality in syntactic distribution. The domain of anaphors can offer an example, specifically about the binding of anaphors with their antecedents. There is crosslinguistic variation in the way anaphors bind to local or nonlocal antecedents. Recall example (3), here repeated as (9). In English *himself* can only refer to *Max* (local antecedent). In a comparable Japanese example like (10) (Thomas, 1995, p. 222), on the other hand, *zibun* can refer to either *Tom* or *Max*. Notice, crucially, that both *Tom* and *Max* are subjects, respectively of the matrix and the subordinate clause.

- (9) Tom said that Max hit *himself*.
(10) Tom-wa Max-ga *zibun*-no butta to iimasita.
Tom-topic Max-nom self-gen hit comp said

English allows only for local binding of anaphors, so the same holds when the antecedent is a nonsubject: Long-distance binding is impossible. In example (11) *himself* can only mean *Max*. Interestingly, Japanese does not allow for long-distance binding either if the antecedent is a nonsubject. Consider example (12) (Thomas, 1995, p. 221): In this case the long-distance binding of *zibun* can refer to Tom's (i.e., the subject's) book, but not to Kim's.

- (11) Tom said that Max showed a picture of *himself*.
(12) Tom-wa Kim-ni Max-ga *zibun*-no hon-ga suki-da to iimasita.
Tom-top Kim-dat Max-nom self-gen book-acc like-cop comp said
'Tom told Kim that Max likes self's book.'

What examples (10) and (12) show is that anaphors can bind to a long-distance antecedent provided this is a subject. Long-distance binding of a nonsubject is not possible. The reason

Table 1 Response “true” in percentages

Groups	Long-distance subject	*Long-distance nonsubject
L2 low proficiency (n = 34)	55	54
L2 advanced (n = 24)	57	14
Native speakers (n = 34)	89	18

is that antecedent and anaphor must be in the structural configuration known as c-command. This configuration holds for a long-distance reflexive like Japanese *zibun*, which can be c-commanded by a noun phrase (NP) subject of a matrix clause. Locally binding anaphors can have subject or nonsubject antecedents. But the c-command configuration does not hold in a bi-clausal sentence like (12), if the anaphor *zibun* is interpreted as having a non-subject antecedent outside its own clause (Thomas, 1995).

Given the facts just described, the Japanese input is under-informative for a learner. While it is clear that *zibun* can bind a long-distance antecedent, the input does not provide clear evidence about the constraints on interpretation, namely, that *zibun* can only refer to a long-distance subject. The question arises whether learners of Japanese whose native language does not allow long-distance binding can learn the properties of *zibun* and disallow binding with a nonsubject in a matrix clause.

Thomas (1995) tested this question with English learners of Japanese at two proficiency levels, low and advanced. The test methodology was a truth-value judgment based on the context provided by a sequence of pictures accompanied by written utterances. Each scenario was followed by a statement which the participants had to evaluate as true or false. There were four items per condition. The aim was to find out whether learners of Japanese are aware of the possibility of long-distance binding of an anaphor to a long-distance subject as opposed to a nonsubject. Table 1 (from White, 2003, p. 49) illustrates the results. The figures represent percentages of “true” responses.

The table shows that low-proficiency learners accept subject and nonsubject antecedents at more or less the same rate. High-proficiency learners, however, appear to be making a clear difference between subject and nonsubject antecedents. Thomas’s (1995) hypothesis concerns a specific subset of learners, namely, those who admit long-distance binding of *zibun*. The question is whether the grammar of individual learners shows the requirement that the long-distance antecedent should be a subject. The criterion used to determine the individual consistency in a particular feature of *zibun* is that of three or four out of four responses. Thomas (1995) identifies 23 out of 54 participants who consistently accept long-distance binding. Out of these 70% reject long-distance nonsubject antecedents of *zibun*.

The study illustrates a case in which learners achieve knowledge of properties of an L2 grammar which are not explicit in the input, that is, a case of poverty of the stimulus in the domain of syntax. UG is assumed to make up for the under-informativeness of the input by providing a framework of categories and operations that limit the search space and, thus, to guide both production and interpretation,

Poverty of the Stimulus in the Syntax–Semantics Interface

The syntax–semantics interface is another domain in which native speakers have knowledge of (un)grammaticality. We find an example in the domain of argument structure, specifically with respect to intransitive verbs (13, 14). These verbs have only one argument, which is realized as a subject. This only argument is in some cases an agent, as in *laugh* (13), and in others a theme, as in *open* (14). While agents make prototypical subjects, themes are

more closely associated with objects (*X opened the door*). There is a parallel between the theme argument as a subject of an intransitive verb (14) and passive subjects (15). (In [15] *the door*, initially the object of the verb *open*, is realized as subject.) Intransitive verbs with a theme subject have been called “unaccusatives” (Burzio, 1986).

- (13) Kim laughed. (intransitive, subject: agent)
- (14) the door opened. (intransitive, subject: theme, unaccusative)
- (15) the door (theme) was opened. (passive sentence)

There is a range of syntactic and morphological effects of unaccusativity in different languages, which makes it a potentially revealing field in which to test the role of UG in L2 acquisition. It is interesting to see whether L2 learners are sensitive to unaccusativity effects.

An indication that this is indeed the case comes from errors of passivization, as observed by Zobl (1989), Oshita (2000, 2001), and Balcom (1997), among others. In examples (16) and (17), from learners’ production, the intransitive verbs are used with passive morphology (Oshita, 2001). Further evidence comes from cases like (18) (Zobl, 1989), in which the subject of the unaccusative verb appears postverbally, a type of inversion only attested with unaccusative verbs. These results are confirmed by experimental studies, such as Hirakawa’s (2000) on the acquisition of L2 Japanese, which shows that English and Chinese learners make a correct distinction between unaccusative and other intransitive verbs.

- (16) my mother *was died* when I was just a baby.
- (17) an accident *was happened*
- (18) I was patient *until dried my clothes*

The studies mentioned show that L2 learners are sensitive to thematic roles and what their default mapping to the syntactic realization is: In cases in which the mapping of thematic roles to syntax is not the default option (i.e., the subject is an agent), the learners resort to passivization or a linear order which reflects the default association of the theme role with the object function. In other words, the learners are making use of linguistic knowledge of aspects not explicitly present in the input.

Poverty of the Stimulus and Properties Not Present in Either L1 or L2

A further type of poverty of the stimulus evidence comes from a learner grammar which could display properties not present in the L1 or the L2, but reflecting general linguistic properties present in other languages. Clearly, in this case the learners must have abstracted those linguistic properties with the help of UG.

An example is found in the already-mentioned study by Parodi (2000) on the acquisition of German by speakers of Romance languages. Parodi finds a consistent difference between modals and auxiliaries (“non-thematic” verbs) on the one hand, and full lexical or “thematic” verbs on the other. These verb classes differ with respect to both morphological properties and syntactic distribution in the learners’ system, although neither the Romance L1s nor the L2 German carry out such a distinction. Interestingly, this distinction between thematic and non-thematic verbs is present in other natural languages, and the most immediate example is English. In this language, non-thematic verbs (modals and auxiliaries) inflect differently from thematic verbs: They have no *-s* in the third person in the present tense,

for example. In addition, this has a syntactic correspondence: Non-thematic verbs appear to the left of negation, a position blocked for thematic verbs. (See [19].)

- (19) Tim will not arrive in time.
 *Tim arrives not in time

These results are taken as an indication that learners are sensitive to the properties of finite and nonfinite verbs and their distribution, and establish a relation between morphology and syntax, although not in the way their L1 or the L2 does it. This is, again, a case in which the linguistic knowledge available to L2 learners goes beyond the evidence in the input.

Summary

The UG approach views language as a mental system and offers a principled account of language learning; in this particular case, of the acquisition of the L2. The account is based on linguistic analyses which make specific predictions about the acquisition process, which can be tested and proved true or false. It looks at how words and constituents are combined to create novel utterances and offers explanations on the properties of the interlanguage: how the learners arrive at the target-like forms in production or the target-like interpretation, as well as why the learners' production and interpretation deviate from those of native speakers of a certain language.

The approach also offers ways of accounting for crosslinguistic variation and how this will work in specific combinations of L1 and L2; that is, it makes specific (testable) claims about the role of the L1 and that of the input (Braid, 1999, p. 74). Exposure to primary linguistic data is imperative and the type of data (naturalistic immersion, classroom material) will undoubtedly shape the learners' output alongside the L1.

The fact that this approach takes a cognitive perspective does not mean denying the existence of other components in language and its acquisition, such as communicative (types of exchange: conversation, a formal written text, etc.) and sociolinguistic aspects (gender, socioeconomic level of the speakers, what the language is used for—e.g., business, education, family language). There are, however, some aspects which are independent of communicative or sociolinguistic aspects. For example, the way a language marks tense (e.g., by suffixes on the verb or by adverbials) and the way an embedded clause is structured are not likely to be affected by the socioeconomic level of the speakers. A change of register is likely to lead to a different lexical choice, but not to a different grammatical choice, such as to mark tense on a noun instead of on a verb. In this sense the approach is complementary to a sociolinguistic approach: They focus on different linguistic aspects.

The UG perspective on L2 acquisition offers linguistically informed explanations of why learners behave as they do, beyond the direct comparison of language strings. These explanations can form the background for psycholinguistic or neurolinguistic testing. They also provide valuable insights which can be incorporated into the design of classroom and test materials.

US Foreign-Language Teaching in Kindergarten to 12th Grade

MARCIA HARMON ROSENBUSCH

Introduction

There is growing recognition in the United States that in order to participate fully in the interconnected world, people need the ability to speak other languages and collaborate with other cultures. This recognition is accompanied by a growing awareness that the US educational system must teach students these skills to prepare them for the future.

The importance of other languages and cultures to US national security was highlighted by the events of September 11, 2001 (9/11). At this time, federal agencies did not have individuals fluent in languages infrequently taught in US schools, such as Arabic, Urdu, and Farsi, who could translate critical security-related information from spoken language, documents, and Web-based communications (Jackson & Malone, 2009). During this past decade, the military also has come to recognize the critical role of foreign-language proficiency and cultural competence for effectively carrying out its work. In response, the *Defense Language Transformation Roadmap* was designed, which requires that all military personnel receive language and regional familiarization training during deployment and that military officers become proficient in a foreign language for advancement (Department of Defense, 2005).

The Committee for Economic Development (2006) has called for an increase in capacity for international commerce and economic development to enable the United States to compete successfully in the global marketplace. To accomplish this, the committee recommends strengthening the educational system to increase the foreign-language skills and cultural understanding of US students to prepare them for working on global teams and negotiating with clients from other countries.

The Historical Context

A rich sociopolitical and historical context has shaped K-12 foreign-language education in the United States. World and national events impacting the direction of foreign-language education include the wave of one and a half million European immigrants (1850–1900), World War I (1914–18), World War II (1935–45), the launching of Sputnik (1957), and the 9/11 attacks (2001). Committed individuals also have had an important influence on foreign-language education. Among these are US Representatives Paul Simon (IL) and Leon Panetta (CA) who were instrumental in catalyzing the 1979 President's Commission on Foreign Languages and International Studies, whose report resulted in a surge in K-12 foreign-language enrollment (D. Edwards, personal communication, January 12, 2010).

In US schools, foreign-language instruction is offered most commonly at the high school level. Over 90 percent of public and private high schools have offered foreign languages during the past 21 years (1987–2008) (Rhodes & Pufahl, 2010, p. 23), even though in 2008 only an estimated 48 percent of public high school students were enrolled in foreign-language classes (p. 28). Foreign-language instruction in middle and elementary schools has been less stable. Between 1997 and 2008, a statistically significant decrease was reported

in the percentage of schools offering programs at middle school (from 75% to 58%) and elementary school (from 31% to 25%) (pp. 22–3). Spanish continued to be the most commonly taught language across K-12 levels of instruction, while French, German, Japanese, and Russian decreased from 1997, and Chinese and Arabic increased (pp. 33, 36).

The traditional pedagogical classroom approach to foreign languages has been grammar, translation, and literature. After Sputnik, when the federal government encouraged the study of mathematics, science, and foreign languages, the audio-lingual method was used, in which listening and speaking is taught through stimulus–response learning. In the 1970s, as a result of research on students’ first language acquisition, the communicative approach, which focuses on the development of a learner’s communicative competence, was proposed. In recent years, online foreign-language learning has emerged as a viable delivery option, whether in formal classes or individual study.

Recent Key Changes in the Profession

Student Standards and Assessment

The Goals 2000 Educate America Act (1994), an important step in national educational reform, recognized foreign languages as a K-12 core curriculum content area as a result of the profession’s advocacy efforts, and provided funding to develop voluntary national student content standards (Phillips & Draper, 1994). In a unique collaborative effort among professional organizations, the K-12 foreign-language standards were developed and published in 1996. Among the challenges in developing the standards were the facts that program models varied widely and that foreign-language programs offering articulated instruction across K-12 levels were rare.

The forward-looking philosophy of the standards emphasizes educating all students and equipping them “linguistically and culturally to communicate successfully in a pluralistic American society and abroad” (National Standards in Foreign Language Education Project, 2006, p. 7). The focus of the standards is on developing communicative competence through three modes of communication (interpersonal, interpretive, and presentational) and five goal areas (communication, cultures, connections, comparisons, and communities). The student standards have been revised twice and expanded to include all levels of instruction K-16 and to address multiple languages. By 2008, the implementation of national or state foreign-language standards in public elementary schools was reported to be at 76 percent; and in public secondary schools at 89 percent (Rhodes & Pufahl, 2010, p. 74).

The communicative approach to foreign-language teaching emphasized in the standards led to the development of performance guidelines that benchmark student language development throughout learning (American Council on the Teaching of Foreign Languages, 1998), providing a basis for, and expanding the types of, student assessment. New approaches to assessment were conceived, including the integrated performance assessment, which measures a student’s classroom progress in meeting the national standards (Adair-Hauck, Glisan, Koda, Swender, & Sandrock, 2006) and *LinguaFolio* (National Council of State Supervisors for Languages, 2009), which involves students in their own self-assessment and goal setting. Additionally, both face-to-face and online assessments expand the options.

Teacher Standards and Assessment

National educational reform included the development of standards for the preparation, licensure, and professionalism of K-12 foreign-language teachers: National Council for Accreditation of Teacher Education standards focus on the accreditation of teacher preparation programs (American Council on the Teaching of Foreign Languages [ACTFL]

2002); Interstate New Teacher Assessment and Support Consortium (INTASC, 2002) standards, on the licensing of beginning foreign-language teachers; and National Board for Professional Teaching Standards (NBPTS, 2001), on the recognition of accomplished teachers. These standards represent a focus on a continuum of professional preparation, from preservice teacher to accomplished professional, and a change in philosophy that integrates theory and practice and focuses on performance rather than coursework.

Challenges in the Profession

Implementing the Teaching of Less Commonly Taught Languages (LCTLs)

The National Language Conference (2005), sponsored by the Department of Defense, brought together leaders from government, industry, academia, and language associations to address the nation's foreign-language capabilities and define a vision for the future. Among the recommendations is to build "upon the foreign language skills and cultural understanding of America's heritage communities" (p. 9). The report also recommends that "elementary and secondary schools should provide incentives for students to enroll in and continue taking foreign language instruction throughout their school years" (p. 11). The National Security Language Initiative (US Department of Education, 2006) followed up on the need to increase the teaching of LCTLs in the nation through projects funded by the Office of the Director of National Intelligence and the Departments of Defense, Education, and State.

The national focus on LCTLs has resulted in an increase in the number of students studying some LCTLs among those elementary and secondary schools offering languages, with a statistically significant increase from 1997 to 2008 in the percentage of these schools that teach Chinese. In fact among secondary schools offering languages, Chinese instruction rose from one percent to four percent (Rhodes & Pufahl, 2010, p. 34).

Educated heritage speakers residing in the United States have been recruited to serve as teachers in LCTL programs, yet their numbers are not sufficient to meet the need. Additionally, the College Board, China's Hanban/Confucius Institute Headquarters, and the National Council for State Supervisors for Languages (NCSSFL) have established a partnership to provide guest teachers from China for US K-12 Chinese programs.

Providing highly qualified and certified LCTL teachers, experienced in the culture of US schools and well versed in the national student foreign-language standards, is a major challenge. Not infrequently, these teachers also are assigned to teach in more than one district or more than one state through distance learning technologies that are typically self-paced and asynchronous, which is a challenging assignment even for US-trained teachers.

Implementing Effective Programs

To achieve an effective articulated K-12 program, whether classes are face-to-face, Web-based, or both, each level of the language program needs to share a similar philosophy and goals and needs to build on what students have already learned to do in the language at the previous level. Students also need to be able to participate in meaningful interpretive, interpersonal, and presentational communication and to receive personalized feedback on their language use. The foreign-language class, therefore, must be of a size for which such student participation and teacher feedback is feasible. Establishing systematic assessment of students' language skills and sharing outcomes across levels of instruction are also critical to program articulation, allowing students to be placed in appropriate classes at the next level of instruction.

The identification or development of appropriate curriculum for heritage language learners is important when planning well-articulated programs. Since heritage learners often come with varied levels of academic preparation and a wide range of linguistic skills, they need to be assessed and accommodated into courses that will further their language skill development. All students, including heritage students, need the opportunity to be awarded graduation credit based on demonstrated mastery of language skills.

Achieving articulated programs requires maintaining the support and funding necessary for elementary and middle school foreign-language programs, both of which decreased in statistically significant numbers between 1997 and 2008 (Rhodes & Pufahl, 2010). Of elementary schools that provided comments on losses in their programs, 85% clarified that the No Child Left Behind Act of 2001 had had a negative impact on the school's foreign-language program. As one respondent noted, "Funds and time have been directed to reading and math" (p. 76). Implementing articulated foreign-language programs that effectively build language skills across K-12 levels of instruction continues to be a significant challenge.

Ensuring High-Quality Teachers

A review of research and successful programs indicates that the single most important factor in whether students learn the foreign language is the competence and skill of the teacher, including both the teacher's proficiency in the language and culture and their professional knowledge and skills (Jackson & Malone, 2009, p. 18). While the NCATE, INTASC, and NBPTS teacher professional standards have enhanced the training and certification of elementary and secondary foreign-language teachers, challenges remain.

One of the most significant challenges is the development of alternate, fast track, and effective preparation and certification of individuals with a high level of language proficiency and cultural knowledge. This is particularly important with LCTLs teachers who are recruited from abroad and then trained in the United States by methods instructors or peer teachers who do not have experience in teaching character-based languages that lack cognates.

Another important concern is in the ways in which higher education meets the preservice teacher preparation requirements. Methods instructors who are generalists, without a foreign language or who lack experience teaching at the K-12 level, may be assigned to teach the foreign-language teacher preparation courses and supervise field experiences and student teaching.

An additional concern is in providing accessible, ongoing professional development opportunities specifically designed to enhance the understandings and skills of practicing K-12 foreign-language teachers in conjunction with new developments in the field. For example, White (2006) reports that many foreign-language teachers are not prepared to engage their students with those from other languages and cultures in technology-mediated interactions that are pedagogically sound. In fact, more than 60% of foreign-language teachers report that, more than any other kind, they want to receive technology-related professional development (National Research Center for College & University Admissions, 2009, p. 22).

Research

To further strengthen its case for building national capacity in foreign languages, the profession should expand research on foreign-language education and make research findings accessible to the profession and the community. Minimally, the profession should advocate for funding to collect annually, analyze, and report on K-16 student language enrollments and K-16 foreign-language teachers by language, rather than every five to

ten years as is current practice (Jackson & Malone, 2009). The profession also should research the proficiency levels attained by K-12 students in various program models and language learning, itself, especially the effective uses of technology as a tool in language learning. Additionally, the profession should strongly encourage the administration of the National Assessment of Educational Progress (NAEP) in foreign language, which was developed but never administered.

Future Needs

A national initiative on standards, the *Common Core Standards Initiative* (Council of Chief State School Officers [CCSSO], *n.d.*), is currently underway, cosponsored by the Council of Chief State School Officers with the National Governors Association Center for Best Practices. This initiative is an effort to create greater commonality and rigor in K-12 curriculum content across the 51 states and territories that have committed to collaborate on the project. This initiative currently involves the development of voluntary standards for college- and career-readiness and new, internationally benchmarked K-12 standards for mathematics and English-language arts. For the new K-12 content standards, an assessment system will be developed to measure student performance and professional development for educators will be redefined.

Should the development of standards for additional content areas besides mathematics and English-language arts occur, the foreign-language profession would once again need to negotiate a position of inclusion among the subjects considered essential to the K-12 curriculum. Clearly, professional unity and advocacy continue to be important tools for the K-12 foreign-language profession.

This time, however, the profession will not be alone in clarifying to the nation the importance of studying foreign languages and cultures. Among the national reports supportive of K-12 teaching of foreign languages, the National Research Council has argued that “the pervasive lack of knowledge about foreign cultures and foreign languages threatens the security of the United States as well as its ability to compete in the global marketplace and produce an informed citizenry” (O’Connell & Norwood, 2007, p. 1). Additionally, the CCSSO in its 2006 Global Education Policy Statement clarified its belief:

that students will be best poised to achieve their full potential and contribute most to society when they have complete access to a system of education that recognizes and incorporates best practices from around the globe, teaches skills and knowledge necessary for success in the 21st century, and utilizes high-quality and rigorous curricula, including instruction in world languages and cultures. (CCSSO, 2006, p. 3)

This statement is powerful evidence that we are coming to consensus in our nation on defining K-12 foreign-language instruction as a priority. Clearly, foreign-language teaching at the K-12 level has much to contribute to the preparation of our nation’s youth and the future of our nation in a globalized world.

Uses of Language Assessments

ANNIE BROWN

Introduction

Language tests are used in many contexts and for many purposes. Language test scores are used to make many types of decision about people and programs. They are used, inter alia, to screen, place, and classify students; to hire, promote, or even dismiss employees; to provide diagnostic information and to inform language interventions; to evaluate the effectiveness of language programs and to act as tools for data gathering in research. Tests are used to make decisions which, in many cases, can have serious implications for the life chances of test takers.

Test use, or purpose, is frequently cited as the first consideration in test design (see, for example, ILTA, 2007). Davies (1990) states that *Why do we test language?* is the first question that a language test constructor should pose, and must be asked before we can resolve the *what*, or content question. This is because the purpose for which the test will be used drives the definition of the skills to be tested—the domain specification—so that a test may have a general or specific purpose, and may focus on one or more language skills or components of language ability. So, for example, if a test is to be used for selection or admission, the designers need to define the knowledge and skills required to succeed in work or study in the specific context. Similarly, if a test is to be used for placement into syllabus-based levels within a language program, the designers need to start by defining the knowledge and skills required at each level in order to place students appropriately. In the next section we will provide an overview of the ways in which test use has been characterized in the language-testing literature.

Test use is central to validity theory, whether in a traditional or more current conceptualization. Validation is concerned with the gathering of evidence which supports or refutes the inferences that are made about test takers based on their performance on the test, and the decisions that are made about learners based on their test scores. It is, therefore, fundamentally about test use. According to Kane (2006, p. 17),

To validate an interpretation or use of measurements is to evaluate the rationale, or argument, for the claims being made, and this in turn requires a clear statement of the proposed interpretations and uses and a critical evaluation of these interpretations and uses.

In the last section we will discuss the role of test use in evolving theories of test validity.

Test Use: Traditional Classifications

Language tests have been classified according to their purpose or use in a number of ways. However, in general, three broad uses of language tests are distinguished—test use for the assessment of language learners, test use for language program evaluation, and language test use for or within research (Bachman, 1990; Davies, 1990).

Test Use for the Assessment of Learners

The assessment of learners is perhaps the broadest of the three categories, and the language-testing literature reveals a number of ways of describing test use for the assessment of learners. These include proficiency, achievement, aptitude, diagnosis, placement, progress, admission, and selection (Alderson, Clapham, & Wall, 1995; Hughes, 2004, *inter alia*). Davies et al. (1999, p. 205) identify three main purposes: proficiency, achievement, and aptitude, each of which can have further distinctions.

A proficiency test, for example, may have a selection, placement, or diagnostic purpose as well as offering a means of certification of language proficiency. Alternatively, an achievement test may, in addition to indicating progress, also be used for certification or form part of a process of program evaluation. An achievement test may also have a diagnostic function, which in turn may assist in selection or placement decisions, or it may simply be intended as a means of motivating students to learn. An aptitude test is likely to be used to assist in decisions about selection of participants for a course of instruction.

Another approach is to distinguish uses of tests by the point in the instructional cycle at which they occur, an approach taken in the classification of educational tests more generally. Thus Bloom, Hastings, and Madaus (1971) distinguish initial evaluation (used to diagnose strengths and weaknesses and to place students into classes or courses), formative evaluation (used to evaluate progress during a course), and summative evaluation (used to measure attainment or achievement at course completion). Following this approach, Bachman (1990) classifies language tests according to their intended use as follows: admission decisions (which includes selection, entrance and readiness tests), identification of the appropriate instructional level or areas where instruction is needed (placement and diagnostic tests), and decisions as to whether individuals should progress or are attaining the program's objectives (which includes progress, achievement, attainment, or mastery tests).

Here, as a framework for discussing test uses further, we distinguish four points at which assessments are used:

- gatekeeping assessment, used prior to entry to work or study;
- placement and diagnostic assessment, used at the commencement of a course of study;
- progress assessment, used during a course of study; and
- achievement assessment, used at the end of a course of study.

Assessment for gatekeeping. Gatekeeping tests (also called entrance, admission, or selection tests) are tests used to inform decisions about entry to courses, institutions, or professions, although a language test is typically used in conjunction with other information, such as evidence of academic or professional skills, rather than on its own. Gatekeeping tests are often designed to measure the proficiency of the test taker relative to a specific real world purpose, for example, whether she knows enough of the target language to follow a lecture, or to work as a tour guide. Because gatekeeping tests are not based on a course of instruction, test design tends to derive either from a theory of language for a general proficiency test, or from the findings of a needs analysis for a specific purpose test (see Douglas, 2000).

Standard setting is a critical issue in gatekeeping tests, as is the consideration of how to deal with test takers who are close to the cut score. Because gatekeeping tests tend to be high-stakes, they often generate preparation courses and have a washback effect on teaching. While most language tests used for gatekeeping are proficiency tests, aptitude tests may also be used to select recruits into a language program. A more controversial use of language tests as gatekeeping instruments is to determine eligibility for asylum, migration,

or citizenship. While this is by no means a new application of language tests, it is currently an issue which is receiving much attention in the language-testing literature.

Assessment for placement and diagnosis. Placement and diagnostic tests are designed to identify the appropriate instructional level for learners and to identify test takers' strengths and weaknesses, or areas where instruction is needed. Information from such tests is typically sought at the beginning of a language course, for planning of courses of instruction, identifying areas where remedial instruction is necessary, or both. According to Davies et al. (1999, p. 41),

Relatively few tests are designed specifically for diagnostic purposes. A frequent alternative is to use achievement or proficiency tests (which typically provide only very general information), because it is difficult and time-consuming to construct a test which provides detailed diagnostic information.

Assessment of progress. Also called formative assessment, progress tests or assessments are administered during a course of instruction and used to measure the progress that students are making toward defined goals. The content of such assessments is generally drawn from the course objectives, and is relatively narrow in focus. The results may be used to inform the decision as to whether to move on to the next unit or provide remedial instruction. Progress tests and assessments tend to be developed in-house or drawn from a course book.

In response to the development of social constructivist perspectives, the view of the role of formative assessment has changed from simply being a measure of progress to serving the purpose of promoting students' learning actively. This is reflected in models of assessment such as assessment for learning (Black & Wiliam, 1998; Black, 2003) and dynamic assessment (Poehner & Lantolf, 2005; Poehner, 2009). In these models, assessment does not simply support learning from the outside; learning occurs *within* the assessment process.

Achievement assessment. Achievement tests are typically administered at the end of a course of study in order to evaluate the extent to which students have mastered the course objectives. Such assessment is also known as summative assessment. The content of achievement tests typically samples from the full set of course objectives. The results of the test may be used to inform the decision as to whether student should move on to the next level, may be used to certify students as having completed a program and reached a certain level of proficiency or content mastery, or indicate linguistic readiness to move into another type of study program or work context.

Test Use in Program Evaluation and Research

Davies (1990) and Bachman (1990) distinguish the use of language tests to assess individuals from other uses, including their role in evaluating language programs and their research function. Tests may play a role in both formative and summative program evaluation, along with other forms of data, both quantitative and qualitative. Tests can be used as pre- and post-measures, or post-measures alone, according to the research design. Tests may be selected to reflect theory or the program syllabus (termed *program neutral* and *program specific* by Beretta, 1986), and be norm- or criterion-referenced, again depending on the design of the study (see, for example, Lynch, 1996).

As research instruments, Bachman (1990) argues that language tests can support research into the nature of language proficiency, language processing, language acquisition, language attrition, and language teaching. Davies (1990) distinguishes research from experiments: in research, language tests are used to test hypotheses about language and language learning, whereas in experiments, they are used as tools in language learning studies.

Test Use and Test Validity

Validity refers to the degree to which evidence and theoretical rationales support the adequacy and appropriateness of the interpretations of test scores entailed by the proposed uses of tests (Messick, 1989). Thus, we do not refer to the validity of a test but to the validity of the interpretation of a score *for a particular purpose*. In this sense, then, test use drives the validity argument. A test score may be appropriately, or validly, used for one purpose, but not for another. While the way in which validity has been conceptualized over the years has changed somewhat, the role of test use as central to the validity argument has not changed.

Validation involves the gathering of various types of evidence to support the use of a test for a particular purpose, and validity refers to the degree to which the evidence supports the inferences that are drawn from the scores and the use that is made of them. Different aspects of validity draw on different types of evidence, such as content evidence, criterion-related evidence, and consequential evidence, which together contribute to a unitary concept of validity (Messick, 1989, 1994). So, for example, content evidence is concerned with the operationalization of the construct and involves an evaluation of the extent to which the content of the test is relevant to the target language use context. This is of particular concern in the development of a specific purpose language test (Douglas, 2000) or, in the case of a placement, progress, or achievement test, the extent to which the test adequately represents the curriculum. Criterion-related evidence examines the relationship between the test and another measure which is known to be valid. This may be another test (concurrent validity) or performance in the target context using, for example, grade averages or supervisor evaluation (predictive validity). Criterion-related evidence is thus crucially concerned with test use. Recent developments in validity theory (e.g., Kane, 1992, 2006; Mislevy, 1996) take an argument-based approach, in which a validity argument is constructed to provide an overall evaluation of the proposed interpretations and uses of test scores through an analysis of evidence for and against the proposed interpretation or use. Validity is a matter of degree and depends on the soundness of reasoning, or plausibility of the interpretive argument. These theories are beginning to be used in language test validation, most notably in the validity argument developed for the TOEFL iBT (Chapelle, Enright, & Jamieson, 2008).

Consequences of Test Use

While the consequences of test use have always been important to validity, it was not until Messick that they were explicitly referred to as an integral aspect of construct validity, what he termed *the consequential aspect of validity*. In Messick's view, social values and social consequences cannot be ignored in considerations of test validity. "The questions are whether the potential and actual social consequences of test interpretation and use are not only supportive of the intended testing purposes, but at the same time are consistent with other social values" (Messick, 1995, p. 741).

In light of the positioning of the consequences of test use as an aspect of test validity, a number of language-testing researchers (e.g., Davies, 1997; Hamp-Lyons, 1997; Kunnan, 2000) have raised the questions of whether, or to what extent, testing specialists should take any responsibility for decisions about non-intended use of tests or for unintended consequences of test use. In other words, at what point does the test developer's responsibility end? What if, for example, the threshold on a test used to determine whether prospective immigrants have sufficient English is raised in order to limit the number of entrants during an economic downturn? Davies (2008) argues that it is not possible for a tester as a member of a profession to take account of all possible social consequences and seeks, it seems, to limit responsibility to the more traditional validity concerns: "What can

be done is the internal (technical) bias analysis and a willingness to be accountable for a test's 'fairness.' In other words, limited and predictable consequences we can take account of and regard ourselves as accountable for" (2008, p. 433). Others, within the framework of critical language testing (Shohamy, 1998, 2001a, 2001b; Lynch, 2001), argue that language testers have a responsibility to challenge the status quo in order to "protect [society] from undemocratic principles" (Shohamy, 2001b, p. 373).

In fact, the increasing use of language tests as a means of making decisions about individuals and programs and the growth of language testing as an industry in the 20th century has led to increasing concern about the appropriate and inappropriate uses of tests and ethical action on the part of testers and testing organizations. Despite McNamara's claim of "a reluctance on the part of the language-testing profession to seriously engage with language testing as a social and political practice" (McNamara, 2008, pp. 422–3), not only have professional organizations begun the development of codes of ethics (see, for example, ILTA, 2000) but there is a growing body of writing on the social and political consequences of test use, and the use of tests as instruments of social control, for example to determine immigration, citizenship, and professional entry and progress (Spolsky, 1995; Shohamy, 2001a; Eades, Fraser, Siegel, McNamara, & Baker, 2003; Hawthorne, 2005; McNamara, 2008; Blackledge, 2009; Kunnan, 2009, *inter alia*). More of a challenge is "the lack of an adequate theory of the social context in which tests find their place even within discussions of the social dimensions of language tests" (McNamara, 2008, p. 423).

Conclusion

Language test use has always been central to test design and test validation. Test purpose drives the definition of the test construct; and the validity of the inferences that are drawn about language learners based on their test performance are dependent on the test being appropriate for the use to which it is put. More recent conceptualizations of validity view test use in broader perspective, as an ethical issue, and this is reflected in the language-testing literature through discussion of professional ethics and presentation and discussion of particular cases of language test use and abuse.

Using Metalinguage in Teaching

HELEN BASTURKMEN

The term *metalinguage*, or “language about language” (Berry, 2005, p. 3), is used increasingly in the language teaching literature. Some writers use the term to refer to technical and semi-technical linguistic terminology, such as *verb complement* and *sentence* (Ellis, 2005b, p. 151) and some to refer more widely to any use of language to analyze, describe, or articulate language, including nontechnical terms, such as *mean* or *say* (Basturkmen, Loewen, & Ellis, 2002, pp. 7–8). To illustrate, in a language teaching classroom, a teacher might say “to be fed up with someone *means* you’re a little bit annoyed with their behavior,” or a student might ask “is it a *noun*?” Metalinguage plays a key role in pedagogic grammars. These grammars often include a glossary of terms reflecting the view that learners need to be familiar with at least some key terms in order to avoid “tortuous, confusing circumlocutions” in discussions of the target language (Fortune, 2005, p. 22).

The term *metalinguage* and the associated term *metalinguistic explanation* are used in conjunction with a range of linguistic forms and features, including grammar, lexis, phonology, and discourse. In instruction on pragmatics, the related terms *metapragmatic comment* or *metapragmatic explanation* are used to denote language or description of pragmatic forms and features, such as speech acts and politeness (Eslami-Rasekh, Eslami-Rasekh, & Fatabi, 2004; Alcón Soler, 2005). For instance, the terms *imperatives*, *interlocutor*, *requests*, and *order* are used in the following metapragmatic explanation of request speech acts, which is taken from Alcón Soler (2005):

Imperatives are used to ask people to do something when one of the interlocutors has a higher position or they know each other very well. Example: In making his request O’Neill uses an order (*Daniel, shut up*) which shows he knows Daniel very well. (p. 431)

The subject of metalinguage appears in discussions of explicit language knowledge and language awareness. In language learning, a distinction is drawn between learners’ implicit and explicit language knowledge. The former comprises unanalyzed knowledge which learners are either unaware of or cannot articulate and the latter comprises analyzed knowledge which they are aware of or can articulate (Ellis, 2005a; Roehr, 2007, p. 179). Metalinguage is thus seen as part of a learner’s explicit language knowledge. Although connected, language awareness and metalinguage are not synonymous. It is possible for a learner to demonstrate language awareness without using metalinguage. For example, a learner may be able to identify and correct an error but not be able to explain the error or state the rule behind it (Berry, 2005, p. 12). Researchers typically define “metalinguistic knowledge” for the purposes of research as the ability to correct, describe, and explain errors (Roehr, 2007, p. 175). The available evidence indicates that learners’ metalinguistic knowledge is related to language proficiency (Elder & Manwaring, 2004; Roehr, 2007), although findings related to the strength of the relationship vary across studies.

One important issue is whether the use of metalinguage in language teaching is helpful. Arguments made in favor of using metalinguage in language teaching include its role and value in grammatical explanations, metapragmatic explanations (Alcón Soler, 2005), editing writing (Cajkler & Hislam, 2002), helping learners repair spoken errors (Bouffard &

2 USING METALANGUAGE IN TEACHING

Sarkar, 2008), self-study and accessing accounts in grammar materials (Berry, 2004, 2005), helping advanced learners understand difficult semantic relations and teaching “analytical” learners (Hedge, 2000, p. 160), and helping learners focus their attention on linguistic forms during collaborative writing tasks (Fortune, 2005).

However, there are also arguments against the use of metalanguage in language teaching. These include its potential to be unintelligible for low-proficiency learners, young learners, and low-literacy adult learners. It may simply be more appropriate to “guide students into seeing patterns” (Hedge, 2000, p. 160) rather than delving into talking about language through explanations and descriptions. The latter argument is related to the debate over the relative merits of explicit instruction (instruction involving rule explanation) and implicit instruction (instruction not involving rule explanation and not directed at any specific language form) (see Ellis, 2005a, pp. 716–17). Whether the teacher adopts a deductive approach to explicit instruction (starting with the explanation or rule) or an inductive approach (starting with samples of language, and for example using consciousness-raising tasks that require learners to try to formulate a rule based on their observations of a targeted language item in the samples), the question remains “as to whether talking and thinking about grammar... requires a technical metalanguage or whether it can be done in non-technical ways” (Hedge, 2000, p. 163).

Metalanguage may also feature in questions and queries about language arising incidentally in the language teaching classroom. Basturkmen et al. (2002) investigated the use of metalanguage in focus-on-form episodes occurring in meaning-focused communicative activities in lessons for young adult, intermediate, and pre-intermediate learners in a private English-language school setting. These were episodes in which students and the teacher attended to linguistic items triggered by problems in students’ utterances or the students’ or teachers’ wish to clarify a linguistic feature. Teachers and students were found to use metalanguage in around one third of such episodes, and in student-initiated episodes the use of metalanguage appeared to correspond to subsequent attempts to produce the targeted form. The following example illustrates a student-initiated focus-on-form episode. In this episode, two “technical” metalinguistic terms are used (*syllable* and *stress*). Student 1 attempts to use the targeted form (preDICTion) in the follow on move.

Student 1: PREdiction?

Student 2: I think the second syllable is stressed

Student 1: preDICTion

Teacher: preDICTion. (Basturkmen et al., 2002, p. 6)

As described above, the use of metalanguage in language teaching is a subject of some debate. It is, however, generally recognized that metalanguage does play a role in language teaching in many contexts.

Using Popular Culture in Language Teaching

PATRICIA A. DUFF AND SANDRA ZAPPA-HOLLMAN

Defining Popular Culture

Although popular culture is pervasive in contemporary Western and other highly urbanized, postindustrial societies impacted by globalization, it can be difficult to define and delimit the term. That is because popular culture means different things—both theoretically and practically—to different people, and what is “popular” today can lose popularity quickly as the novelty wears off and new cultural forms emerge (Storey, 2006). Television programs, commercials, movies, sports broadcasting, radio programming, hip-hop, online media, blogs, YouTube, concerts and poetry slams, computer games and simulations, comic books and trade fiction, and various social media, texting tools, and clothing fashions can all be considered contemporary manifestations of popular (pop) culture—usually with mass (commercial) appeal and relevance to large swaths of the population. Because of the way these media attract large numbers of people, and because culture learning is generally considered an integral part of language learning, pop culture has a potentially powerful and motivating role to play in second language (L2) education and socialization (Murray, 2008).

Rationale for Integrating Appropriate Pop Culture in Contemporary Language Education

Learning about and participating in pop culture consumption, production, and critique is an important part of language learning and socialization into new cultures and is also an aspect of critical literacy (Zuengler, 2004) and critical praxis (Mackie & Norton, 2006). Another rationale for engaging language learners in pop culture practices is that they can potentially be immersed in language and interaction outside of classrooms and can become connected virtually or in person with others with a passion for the same cultural forms and practices. Being conversant with cultural forms of widespread interest in a community is a way of finding a common platform and greater integration into local social networks and values. Pop culture by definition is a vernacular form of culture that has immediacy, currency, and cachet—providing students symbolic, social, and cultural capital in their encounters with others. Having students do projects involving adaptations of pop culture or their own creations, becoming very familiar with particularly significant cultural genres, can enhance their understanding of the host culture or other cultures.

Incorporation of Pop Culture in L2 Education

Scholarship highlighting the educational value of pop culture for the second language or foreign language classroom has focused on materials such as comic books, manga, anime,

2 USING POPULAR CULTURE IN LANGUAGE TEACHING

film, TV soap operas, hip-hop music, and online tools such as Twitter and social networking sites, thus covering a wide range of genres and media. In the 1990s and early 2000s, work focused on how to incorporate film, comic books (e.g., *Archie* comics, *Spiderman* superhero texts), and television content effectively into first and second language classroom literacy events and discussions (Norton & Vanderheyden, 2004; Mackie & Norton, 2006; Ranker, 2007). The linguistic accessibility of these comics or graphic novels (short dialogues, images, brief descriptive prose) as well as their appealing content and format (colored cartoons usually in strips) help engage young language learners, especially in literacy practices and discussions about social and cultural themes.

Manga, Japanese comics in graphic-novel format, and anime, animated cartoons, both long-standing pop culture staples in Japan, have gained such popularity in North America that they are being used to support and motivate learners' Japanese and English first and second language literacy (Black, 2006; Fukunaga, 2006). Both types of material can also provide a window on cultural representations traditionally ignored in the L2 classroom, and expose learners to samples of situational discourse that may challenge stereotypical, static notions of the language. Viewers and readers can also take part in collaborative fan fiction communities revolving around anime and other print-based texts or multimedia in which they can create their own texts (Black, 2006). Manga can engage readers in complex multiliteracy practices that support students' development of higher-order thinking skills. Similarly, while fictional, anime can serve as a springboard for discussions on global issues, on themes that might be taboo in certain cultures, on gender representations, and on different aspects of Japanese culture (Fukunaga, 2006).

Television genres like soap operas or telenovela (particularly popular across South America), which include (melo)drama and mystery, have also made their way into the L2 classroom. For instance, the very successful *Destinos* Spanish language series created by Bill VanPatten and colleagues in the early 1990s in the telenovela format is available in VHS and DVD and now also accessible online, free, for personal use through Annenberg Media (www.learner.org/resources/browse.html?discipline=3). Similar online digital tools, videofiles, and narratives exist for teaching English and French L2 learning (see aforementioned Web site). More recently, the BBC developed *Mi Vida Loca*, an interactive Spanish drama/mystery series presented in short downloadable chapters available online (www.bbc.co.uk/languages/spanish/mividaloca/). Korean soap operas (e.g., *Jewel in the Palace*) have become a pop culture sensation in Korea, elsewhere in Asia, and in North America and these can also be adapted for Korean language education purposes. While the above examples are simulated-authentic materials, the plots, themes, character development, and story pace emulate the real-life (or historical) characteristics of this pop culture TV genre, thus bringing to the L2 classroom aspects of the target culture which are usually not included in educational materials.

Film, another important, fairly universal visual genre, also represents a popular and accessible source of target linguistic and cultural knowledge for the L2 learner. French-language classrooms, for instance, can draw on film as a resource to teach about *la francophonie* (the French-speaking world) and its diversity across regions (Rose, 1997). In the ESL (English as a second language) classroom, the advantages and limitations of using film for language education and critical thinking have been addressed from a critical pedagogies perspective by Mackie and Norton (2006).

Hip-hop culture and rap have also been identified as powerful transformative pedagogical tools despite their marginal position in mainstream education, and are highly popular among youth worldwide (Alim & Pennycook, 2007). In a variety of language classrooms, these genres are being used to tap into students' creativity and interests in the target language, provide practice across language skills and genres, and engage students in sociocultural critique, commentary, and identity work.

Myriad possibilities for L2 teaching and learning through the Internet also exist. Weblogs (blogs) and podcasts give learners remote access to target-culture speakers' views on topics and issues relevant to their daily lives; through Twitter, an Internet tool for posting short commentaries online, students learn about issues relevant to contemporary target-culture society by, for instance, following news "tweets" (short postings) which provide a constant flow of information on current events (Scinicariello, 2008). Many popular television dramas now also have online components, wikis, chatrooms, and other forums to enable viewers to exchange opinions about unfolding events (Williams, 2008). Online video games and social networking sites such as Second Life are used as platforms to launch L2 learners into a virtual target-culture immersion experience that recreates aspects of real life, and gaming and related social networking for language learning are attracting widespread attention now from language learners, instructors, and researchers (Thorne, Black, & Sykes, 2009; Zheng, Young, Wagner, & Brewer, 2009). Games can be adapted and used for more academic purposes, such as producing short documentary-like programs in the virtual space of Second Life or researching and producing YouTube videos on a topic chosen by students. Several university Chinese-language programs in the USA (e.g., Second Life "Chinese Island" at Michigan State University's Confucius Institute and "MyChina Village" at the University of Oregon) are experimenting with Second Life as a virtual space in which learners can experience simulated, highly situated aspects of Chinese language and culture and also interact with other "real people" (via their avatars) in the same space using Chinese. Zheng et al. (2009) researched native and non-native English speakers' interactions in the virtual world Quest Atlantis as a way of developing the learners' English proficiency. In online spaces, students can observe and appropriate different identities and the language that goes with those identities, can have more access to different registers, genres, and language structures than they might have access to in the classroom or in their own communities, and can explore new social worlds with others (e.g., Harrison & Thomas, 2009). Learning in this manner has the potential to become highly social, distributed, collaborative, and experimental.

Discussion

There are several advantages to using pop-culture-infused instructional materials: its incorporation of vernacular language and multimedia broadens course language and cultural content, and exposes students to cultural forms of current interest to a segment of the target language culture (e.g., that of their peers). It serves as a catalyst for increased motivation and language practice, and provides opportunities for developing learner autonomy. In addition, the hybrid, multimodal nature of some pop culture texts fosters creativity and the development of critical thinking skills and multiliteracies.

Although some of the topics represented in pop culture material may help learners negotiate identities and challenge stereotypes, not all students will be equally ready to embrace the sometimes crude forms of language, street culture, and subversive messages in these texts; issues of sexuality, violence, or other social concerns may render the material inappropriate, particularly in sensitive multicultural contexts and in formal classroom learning. Moreover, pop culture material presupposes a great deal of linguistic and cultural background knowledge. For example, a TV show like *The Simpsons*, which has enjoyed record-setting popularity in many countries for nearly two decades, is highly intertextual and includes references to a wide range of social, political, cultural, and other contemporary issues (Duff, 2004). Thus, the show can be interpreted on different levels, but it can be quite inaccessible to outsiders or novices. It also requires instructors to have a deep understanding of (cross-)cultural references. Educators must, therefore, be aware of the obstacles

faced by newcomers to environments that are rich in those same elements with which they may lack experience (Duff, 2001, 2002, 2004). In addition, when it becomes out of date, pop culture material loses its power, so it needs constant updating. Lastly, not all students appreciate the content of pop culture: some students, depending on their educational and social backgrounds, purposes, and interests, may actually aspire to learn “higher” forms of culture (such as the canonical “classics” of the language) and not those they consider to be too “low brow.”

In order to make the best use of the affordances of pop cultural media, teachers must also be educated in these new media and into how to incorporate them into instruction appropriately. Pop culture has been studied academically in film school, cultural studies, youth studies, philosophy departments, and elsewhere, but perhaps much less so in teacher education programs. That trend appears to be changing, however, with elective courses on how to incorporate pop culture into language education offered at some universities (e.g., University of Hong Kong), but it needs to be addressed more widely and systematically.

Conclusion and Future Directions

Pop culture offers many possibilities for language educators, language learners, and those who wish to continue to practice their already well-developed language skills and cultural knowledge in new environments. Pop culture outside of the classroom is often simply a form of recreation and entertainment for people; for instructional purposes, however, pop culture must be used with discretion and in a theoretically sound and appealing way in order to meet students’ interests and needs as well as educational and institutional goals. Finally, although practical adaptations of pop culture in L2 learning contexts (e.g., gaming, virtual worlds) abound, there has been insufficient research in applied linguistics and language education documenting learning processes and outcomes in these creative spaces.

Using the First Language and Code Switching in Second Language Classrooms

KATY ARNETT

The place of learners' first language (L1) in the second and foreign-language (SL/FL) classroom has evolved along with the methods of language teaching. The grammar-translation method relied heavily on the learners' L1 to teach the meaning of the target language (TL) and was eventually abandoned in favor of approaches such as the audio-lingual method, which advocated for oral communication in the TL and total exclusion of the L1. The role of the L1 in the SL/FL classroom was largely unquestioned until the 1970s, with the advent of the era of communicative language teaching (CLT). Since that point, the role, purpose, and value of the L1 in the traditional FL/SL classroom have been a more prominent area of debate, with no immediate consensus in sight. Though multiple conceptions of "code switching" exist, for the purpose of this entry, this term will denote the practice of alternating between the L1 and the target language TL at the word, phrase, clause, or sentence level (Timm, 1993, p. 94). Thus, code switching can be intra-sentential or inter-sentential.

Perspectives on the place of code switching in the FL/SL classroom tend to fall into one of three camps: The L1 can/should have an open and active role in the FL/SL classroom with no restrictions on usage (e.g., Cook, 2001); the L1 can certainly be a resource in the FL/SL classroom, but its application and relevance to the learning situation must be clearly defined (e.g., Turnbull, 2001); or the L1 should be excluded completely from the FL/SL environment because it dilutes the ability of the learner to access L2 input and engage in meaningful TL interactions (e.g., Duff & Polio, 1990). As pointed out by Levine (2003, p. 344), and echoed in prior reviews of the topic (e.g., Turnbull & Arnett, 2002), participants in the debate "often base their assumptions and arguments largely on intuitions about best practices, anecdotal evidence, and personal classroom experience."

Prior research has revealed numerous reasons for which the L1 may be used by either teachers or learners, including: clarification of message/meaning; attempts to minimize student anxiety; delivery of certain types of content (e.g., grammar, classroom management); and building rapport with students or among peers, or both, in the class (Rolin-Ianziti & Varshney, 2008). Studies on L1 use within the past decade have revealed more information about the timing and reasons for L1 use (e.g., Chavez, 2003) and the impact of L1 use on the classroom participants, environment, or both (e.g., Rolin-Ianziti & Brownlie, 2002; Levine, 2003; Rolin-Ianziti & Varshney, 2008). Prior empirical studies on code switching most often examined discourse patterns among the teachers and students, which shed light on the communication and teaching functions associated with L1 use (e.g., Duff & Polio, 1990; Polio & Duff, 1994).

Different theoretical frameworks about second language (L2) acquisition/learning hold different positions regarding the proper role of the L1 in the FL/SL classroom. The socio-cultural view, which acknowledges the importance of appropriate scaffolds and collaborative elements of learning, sees the L1 as an additive element to the learning experience

(e.g., Antón & DiCamilla, 1998). Through this view, the L1 can be used in language classrooms as a way to provide support to the L2 learner at strategic moments. Adherents of theoretical views rooted in the value of input and/or interaction, on the other hand, tend to see L1 use as incompatible with the process of how one becomes proficient in a language (e.g., Polio & Duff, 1994). Krashen and Terrell (1983) indicated that learners should not have access to their L1 in the new language environment; meaningful communication in the L2 classroom can only occur in the L2. However, Krashen has since indicated that the L1 can have a value for the classroom, but for this to be so, the L1 cannot discourage the use/presence of comprehensible input in the classroom (Krashen, 2004).

The presence of the L1 in an FL/SL learning environment can be shaped by multiple factors beyond a theory of language learning. In 2002, Turnbull and Arnett published a review of the works examining the reasons for teacher L1 use in the FL/SL classroom. This work revealed multiple influences for the classroom teacher, including: teacher beliefs about language learning and teaching, teacher preparation, institutional policies regarding language use, the relationship/overlap between the L1 and the TL, the lesson objectives, the nature of the task under consideration, and the availability of appropriate teaching materials. For many years within the literature, it has been assumed that teacher L1 use is a strategy for reducing student anxiety (most likely because of concerns about the role of the affective filter in the L2 classroom), but two recent studies of learner perspectives (Levine, 2003; Rolin-Ianziti & Varshney, 2008) revealed conflicting findings about the role of the L1 in reducing anxiety; the former study concluded that L1 use did not diminish student anxiety, while the latter reached the opposite conclusion.

Levine (2003, p. 355) makes three specific recommendations about the place of code switching in the language classroom. These recommendations were informed by an empirical consideration of the relationship between teachers' and students' beliefs about L1 use and learner anxiety in the FL/SL classroom; these constructs had been posited in earlier literature (e.g., Turnbull, 2001). Levine's recommendations included acknowledging that the FL/SL classroom environment should embrace the view that the L1 has a role and value, marking the use of the L1 in the classroom environment, and collaboratively establishing the parameters for L1 use in the classroom.

Levine's recommendation about the marked use of the L1 recalls Myers-Scotton's (1993) markedness model, a theoretical framework which views code switching in relation to the rights and obligations of the interlocutors within a situation; under this lens, Myers-Scotton contends that the speakers have an inherent awareness of which language code is the default form (i.e., the unmarked code) and which language code would be atypical or less natural to use in that context (i.e., the marked code). The use of either code at a particular moment can be used to convey new meanings or ideas to the other interlocutors, such as their membership in a particular group (i.e., as an individual who is multilingual); their attitudes about the other language, its culture, or both; or their being someone who does not know the TL equivalent of the L1 term. As Hinkel (2005) explains further, in the L2 classroom context where learners share the L1, the default unmarked code would be the L1. To ask the students to altogether deny their knowledge of the L1 within the FL/SL environment is in direct opposition to their natural inclination for code usage with each other. Though FL/SL classroom environments that comprise a mix of first languages might more easily establish the L2 as the unmarked code, in general, for many L2 speakers, the L2 will likely represent, to a degree, a marked code. The markedness model and Hinkel's (2005) assessment of what the model means for code switching in the L2 classroom align with the two aforementioned perspectives which envision a role for code switching in the L2 classroom.

The markedness model also facilitates a consideration of bilingual education, which openly endorses the use of two languages in the classroom. In most such circumstances,

either (a) the learners all share the same L1 and are learning the L2, or (b) some members of the class share one L1 and the rest of the class shares another, and the L2 for each group of students is the L1 of the other group. In bilingual classrooms, it is not uncommon to see whole blocks of instruction delivered in either one of the two languages, with potentially specifically designated times, subjects, or both for certain languages. The languages thus coexist, with neither one holding more power than the other in the instructional setting; this is the opposite of the relationship between the L1 and the L2 in the traditional L2 classroom, where the L2 is the dominant language.

As we move further into the 21st century, there is still a demonstrated need for empirical considerations of the role and impact of the L1 on the traditional L2 classroom, so as to properly guide pedagogical and political decision making with sensitivity to different educational and linguistic goals across varied contexts. From what has been learned so far from the research, it is clear that future explorations must continue to consider the link between belief and practice.

Using the World Wide Web for Language Teaching

MARTA GONZALEZ-LLORET

The World Wide Web (“WWW” or “the Web”) is a system of documents interconnected through hyperlinks, or points of reference to information in the same or a different document accessed via the Internet, and visible with a Web browser (i.e., Internet Explorer, Mozilla Firefox, Safari). Although the terms “Internet” and “WWW” are often used interchangeably, they are not exactly the same thing: the WWW is an application built on top of the Internet (World Wide Web, 2008). As of January 2009, with more than 1,463 million Internet users and 218 million Web sites (Pingdom, 2008), the Web has proven tremendously appealing for L2 teaching and learning. In this entry, I first discuss some well-known options for using the Web for language teaching purposes and I then focus on a selection of Web 2.0 tools and their potential for language teaching and learning.

The Web offers an excellent environment where students can find a wide variety of well-constructed, interactive exercises to practice their L2. The advantage of engaging with these exercises on the Web (rather than on paper) lies, first, in the possibility of receiving immediate feedback, which allows a student to notice the gap that there may be between their language and the target language, an important step for language acquisition (Schmidt, 1995). In addition, these exercises include multimodal forms of input (audio, video, hyperlinks, and so forth) which can make the input more salient, richer, and more comprehensible—and, therefore, more productive for L2 learning (Chapelle, 1998; Doughty & Long, 2003). These activities range from grammar-based exercises (see for example Barbara Kuczun Nelson’s Web page: <http://www.colby.edu/~bknelson/SLC/index.php>; and Asencio & Desnoyes: <http://www.ccdmd.qc.ca/ri/aztecas/>) to audio and text comprehension activities, language games (see the BBC Web site: <http://www.bbc.co.uk/worldservice/learningenglish/>), and information search activities (see USC Beaufort Library: <http://www.sc.edu/beaufort/library/pages/bones/bones.shtml> for an excellent basic tutorial on searching the Web). Among search activities, WebQuests are widely used in primary and secondary education. A WebQuest is an inquiry-oriented activity in which students use information from the Web to support their “thinking at the levels of analysis, synthesis and evaluation” (Dodge, 1995, n.p.). WebQuests are student-centered, based on authentic materials (text, video, audio), and include culturally rich information. Students must process this information, usually collaboratively, to create a product, such as a class presentation, document, or exhibit. (See <http://webquest.sdsu.edu/> for more information and examples.)

Truly novel options for language teaching on the Web are what has been called Web 2.0 tools, which are described as mainly services (rather than packed software) involving users actively. They harness the collective intelligence of the users to get richer as more people use them; they have lightweight, easy-to-navigate interfaces, and trust their users as co-developers (O’Reilly, 2005). Included among Web 2.0 tools are virtual immersive environments (VIEs) such as simulations, virtual worlds, and MMOGs (massively multi-player online games), as well as authoring spaces such as blogs and wikis. These tools can be approached individually or as collaborative environments. The latter option may be advantageous for language acquisition, since it promotes interaction and negotiation (Long,

1985), making input comprehensible and pushing students to produce comprehensible language (Swain, 2000). In the remainder of this entry, I will briefly describe a selection of these Web 2.0 tools, focusing on their potential for language teaching.

VIEs are Web contexts, not easily accessible outside the computer, in which students can submerge themselves and become active participants without the pressure of losing face when making mistakes. In addition, VIEs follow the educational principle of “learning by doing” (Dewey, 1998), and they are student-centered activities which allow learners to go at their own pace and spend as much time as desired in the environment, individualizing their learning and respecting their developmental processes (Doughty & Long, 2003). They also keep students motivated by allowing them to set their own goals and decide how to reach them (Bryant, 2006).

Although most of these technologies were created to be used outside the realm of education (see Sykes, 2008 for an exception), recently interest has been sparked in their use in educational settings (Gee, 2005; Shaffer, 2006). See for example the construction of “intelligent and interactive” avatars for different educative settings by Vcom3D (www.vcom3d.com). In all these Web environments, through authentic contact students learn the interactive norms of other participants, appropriate language use, and pragmatic rules. They develop the necessary literacies and intercultural competence to function in the environment (Sykes, Oskoz, & Thorne, 2008) as well as to negotiate their own identities (Gee, 2005).

Authoring spaces, or Web writing tools, are another family of Web 2.0 that offer tremendous potential for language teaching. Among them, blogs are journals written on a Web platform which can include not only text but also multimedia (pictures, video, and sound) and hypertext (links to other pages on the Internet). They can be used individually or collaboratively and they are organized around the person, rather than the subject matter. Blogs allow students to practice L2 reading and writing skills and to collaborate, persuade, and develop ideas not only as individuals in the closed environment of a classroom, but as part of a group in a public arena, a factor which gives them a sense of agency and freedom to express their ideas (Bloch, 2007). Blogs can also be used as tools for peer reviewing and as spaces for collaborative project writing. Numerous sites offer simple, ready-to-use blog services (e.g., Blogger: www.blogger.com/), including blogs for language learning (Eslblogs: <http://eslblogs.org/>). Although blogs can be used for collaborative writing, the chronological order of the postings limits the interactivity of the users. Wikis, on the other hand, encourage truly collaborative writing efforts. The term “Wiki” (“quick” or “fast” in Hawaiian) is short for WikiWikiWeb, an open-editing system in which anybody can edit, add, or delete content on a page. The most popular Wiki is certainly Wikipedia (www.wikipedia.com), a publicly created encyclopedia. Similarly to blogs, the potential of wikis for language learning resides in their collaborative nature and the possibility this has for L2 writing acquisition (Godwin-Jones, 2003; Kessler, 2009).

In this era of electronic information, Web 2.0 tools not only support language learning processes in unprecedented ways but they do so while also stimulating new conceptions of literacy and learning. For these reasons, it is becoming increasingly important for the areas of applied linguistics that investigate language learning to explore how these tools can be exploited and integrated into the L2 curriculum.

Validation of Language Assessments

ALISTER CUMMING

The validation of a language assessment involves, most simply, gathering compelling evidence that the assessment does what it claims to do. Expectations for effective validation, however, have become increasingly complex, sophisticated, and demanding in recent decades. The basis for validation has been theorized, various research methods and technologies have proliferated, and the uses, accountability, and consequences associated with language and other forms of assessments have increased and diversified greatly. Indeed, validation is far from simple. It has come to be conceived as a long-term process of accumulating, evaluating, interpreting, conveying, and refining evidence from multiple sources about diverse aspects of the uses of an assessment to fulfill particular purposes related to its guiding construct(s), including the methods of assessment and reporting as well as other uses of information and activities relevant to the assessment, in both the short and long terms, by diverse populations.

From this current view, arguments for validation of language assessments need to be as substantial, and as fully substantiated and accountable, as are claims for scientific knowledge, public policy, or resolution of legal disputes. Such stringent expectations apply particularly to high-stakes tests, whose results have profound consequences for individuals' career or life opportunities as well as for educational or other public institutions, for example, in determining admission to or completion of educational programs, decisions about immigration or employment, or certification to perform professional or other vocational duties. These uses of language assessment, which make particularly high demands for validity evidence, are at one extreme among the range of purposes for language assessments. Accordingly, the most extensive programs of research to validate language tests have concentrated on a small set of English-language tests that are used widely around the world for high-stakes decisions about university admissions, immigration, and employment, such as the Test of English as a Foreign Language (TOEFL, in its current version as the TOEFL iBT, Internet-based Test; e.g., Chapelle, Enright, & Jamieson, 2008) and Cambridge exams such as the International English Language Testing System (IELTS; e.g., Weir 2004) (see Cumming, 2007; Xi, 2008; Stoyanoff, 2009).

Rigorous validation research is also conducted, though less widely circulated, on a national or state basis for various language tests or exams that certify completion of school or other programs, that judge qualifications for professional licensure, or that serve purposes of monitoring or reforming educational systems (e.g., Brindley, 1998, 2000; Chalhoub-Deville, 2009). Language assessments, of course, also feature in research studies, where the validation of instruments and procedures is an integral assumption. However, as Thomas (1994) demonstrated, greater rigor and precision would be desirable in many reports of research about language learning that involve assessments of second language (L2) proficiency. Expectations for validation evidence and reasoning also obtain where language assessments are less formal, contingent on local situations and standards or shared familiarity and understanding, notably for educational purposes such as diagnostic or achievement assessments, decisions to allocate grades or program completion, aligning program curricula with benchmark standards, or even teachers' responses to routine classroom tasks or assignments or learners' self-assessments (Alderson, 2005; Fulcher, 2008; Council of Europe, 2009; Cumming, 2009).

Concepts of Validity Applied to Language Assessments

The concept of validity, which guides validation practices, is integral to the very idea of assessment (i.e., a procedure, such as a test or a set of tasks, capable of providing information that can be trusted to make certain decisions about people's abilities). Validity features centrally in professional standards as "the most fundamental consideration in developing and evaluating tests," which define validity as "the degree to which evidence and theory support the interpretations of test scores entailed by proposed uses of tests" (American Educational Research Association, American Psychological Association, & National Council on Measurement in Education, 1999, p. 9). General definitions of validity, such as appear in the *Oxford English Dictionary*—"possessing legal authority or force," "technically perfect or efficacious," and "sound and to the point; against which no objections can fairly be brought"—are also relevant to the more technical definitions of validity applied to language assessments (Cumming & Berwick, 1996, p. 1). If an assessment is not valid, why bother using it? Or worse, risk being misinformed by it? Two frameworks have been influential in the professional literature on language assessment in recent decades. The first framework is a theoretical description of the concept of validity, whereas the second focuses on how to engage in the processes of validation through research and argumentation.

Unitary Theory of Validity

Messick (1988, 1989) put forward a comprehensive definition of validity that suggests what the scope of validation research should be for assessments generally. His unitary theory of validity placed central emphasis on the construct (i.e., theoretically and empirically supported concept or ability) being assessed. Messick argued that validation research needs to ensure that results from assessments represent the intended construct accurately and do not underrepresent it or vary unduly because of sources irrelevant to the construct. That is, people's performance on a language test may vary for many reasons such as their first language (L1) literacy, specialized knowledge, or test-taking abilities. However, a valid test of L2 proficiency should ensure that results from the test vary because of the construct being assessed, not other things. For this reason, a valid test needs to define precisely how language proficiency is conceptualized and addressed (recognizing that the construct of "language proficiency" has multiple dimensions and may be conceptualized and evaluated in different ways for different purposes) and to ensure that results from the assessment are not inadvertently influenced by other factors. At the same time, validation is local in the sense of involving a particular purpose for assessment, the definition of language proficiency adopted, unique instruments and procedures to elicit language performance or knowledge, and a specific test-taking population.

Also integral to Messick's unitary theory are two sets of distinctions, which he depicted in a "progressive matrix" to describe and inform the scope and nature of validation research. The first distinction is between interpretations and uses of an assessment. *Interpretations* refer to evidence internal to an assessment, such as analyses of its content, specifications, methods, and values—all focused on the construct being assessed. *Uses* refer to the procedures involved in and information and decisions resulting from an assessment, which also must be consistent with the construct being assessed. Messick's second distinction is between evidence and consequences. *Evidence* for validity may come from a range of empirical methods (described below) to analyze the content, consistency, or patterns in score results, and so forth. *Consequences* consider the values implicit in these empirical data plus the impact or washback that the use of an assessment has on societal systems or groups (e.g., for education, effects on teaching, learning, and instructional materials and for particular populations and situations, in both the short and long terms). Validation

research is obliged to consider all of these aspects of an assessment. Systematic and rigorous evaluation of evidence for and consequences of the assessment are needed, as are careful interpretations of the properties of an assessment and analyses of its ongoing uses for its designated purposes.

Messick's framework was endorsed and adapted for studies on language assessments in Bachman (1990), Cumming and Berwick (1996), and Kunnan (1998). Bachman and Palmer (1996) proposed a framework for operationalizing Messick's theoretical discussion of validity into a widely employed framework for developing, evaluating, and validating the usefulness of language assessments in terms of six qualities: validity, reliability, authenticity, interactiveness, practicality, and impact. Weir (2004) similarly elaborated a framework for developing and validating language assessments suited to both formal tests and informal teaching practices, focusing on analyses of test takers, social contexts, theories of language abilities, response formats, scoring procedures, comparisons between assessments, and impact on society. Recent discussions of Messick's framework, such as McNamara (2006), underscore the need to devote attention to issues of fairness, ethics, and values, which are integral to language assessments, particularly in view of the growing influence of practice-oriented, argument-based validation.

Argument-Based Validation

A more recent presentation of validation, articulated influentially by Kane (1992, 2006), follows from Messick's framework as well as approaches developed originally for program evaluation (e.g., Cronbach, 1988). Kane's ideas emphasize and refine the logic, evidence, and rhetoric of arguments for the validity of an assessment. As Xi (2008, p. 181) observed, "the major strength of Kane's approach lies in providing a transparent working framework to guide practitioners in three areas: prioritizing different lines of evidence, synthesizing them to evaluate the strength of a validity argument, and gauging the progress of the validation efforts." Kane adopted Toulmin's (1958) framework for analyzing argumentation (originally devised to span a range of disciplines) into a set of principles for constructing, substantiating, evaluating, and refining an argument to demonstrate that an assessment does what it claims. Kane distinguished two fundamental steps to construct a validity argument: first, articulating an interpretive argument then, second, developing and evaluating the evidence for the argument as well as rebutting potential counterevidence. Mislevy and colleagues (e.g., Mislevy & Yin, 2009) have proposed similar principles and criteria, asserting the importance of careful reasoning and empirical evidence from task performance in the design of validity arguments supported and evaluated by systematic validation research.

Bachman (2005) further articulated these ideas to prescribe the reasoning and research needed for validation of the uses of a language test. Bachman and Palmer (2010) integrate this approach into a single "assessment use argument," providing conceptual links between interpretations, decisions, and consequences as well as a comprehensive approach to issues of fairness. To date, the most extensive application of validity argumentation to a specific language assessment has appeared in Chapelle et al.'s (2008) documentation of the planning, research, and development that, over more than a decade, went into redesigning the TOEFL iBT. The extent and rigor of this particular project imply that the resources required for such programmatic validation research may be available (or even worthwhile) only for high-stakes, consequential tests used on a large scale. At the same time, this example attests to the fundamental necessity of extensive validation research and systematic reasoning in all language assessments, setting high standards for expectations about validation evidence and logical argumentation, as well, in less demanding or local contexts.

Approaches to Validation Research

That validity requires careful reasoning and strong supporting evidence has long been a fundamental principle in research in the social sciences. Seminal books on research methods, such as Campbell and Stanley (1963), popularized the centrality of validity in the design and analysis of experimental types of research half a century ago. These authors distinguished between evidence and inferences related to (1) the internal validity of a research design (i.e., the extent to which results can be attributed directly to experimental conditions) and (2) its external validity (i.e., the extent to which results of the research generalize to populations or settings other than those investigated directly). Campbell and Stanley enumerated the common threats to validity in research, observing that most research studies in the social sciences aim to achieve internal validity at best, but seldom aspire to results that could apply generally across contexts (e.g., through stratified random sampling of research participants to represent full populations in a society). In recent decades, the concept of validity has remained fundamental in all empirical research, though experimental types of research have seldom been applied to language tests. Instead, argument-based approaches to test validation have expanded the concept of evidence relevant to validity greatly so as to include a wide range of reasoning, methods, evidence, and purposes of inquiry, including qualitative as well as quantitative orientations.

Xi (2008) provided a comprehensive synopsis of methods commonly used to gather empirical evidence used in validation research for language tests, organizing these as a sequence of inferences that progress logically through phases in establishing the type of validity argument Kane suggested:

- *evaluation* to link test performance to observed scores (e.g., by analyses of test conditions, scoring rubrics, rating processes, or rater bias);
- *generalization* to link observed scores to the universe of scores (e.g., by reliability or internal consistency analyses, including Rasch analyses and generalizability studies);
- *explanation* to link the universe of scores to their interpretations in test contexts (e.g., by factor analyses, structural equation modeling, experiments, group difference studies, analyses of discourse produced during test performance, observations, or self-report methods such as verbal reports, interviews, questionnaires);
- *extrapolation* to link the universe of scores to interpretations to real-world situations (e.g., by needs analysis, corpus analysis, follow-up studies, or connections to external criteria such as grades in courses); and
- *utilization* to link interpretations to uses (e.g., by analyses of score reporting, decisions made based on test results, and long-term consequences for institutions or stakeholders, i.e., washback).

As Xi's categories (or related discussions and examples in Weir, 2004; Bachman, 2006; Cumming, 2007; or Stoyanoff, 2009) demonstrate, the research methods employed to validate language assessments have recently taken many forms, including discourse analysis (e.g., Lazaraton, 2002), verbal reports (e.g., Green, 1997), or interviews and observations of teachers (e.g., Wall & Horák, 2008)—alongside the conventional types of correlational or factor-analytic analyses of scores established since the 1960s for large-scale language tests (e.g., by Lado, 1961), which in turn have themselves taken increasingly complex and sophisticated forms. Functionally, these approaches to research aim to provide evidence for the following in language assessments:

- *content relevance*, using corpus, task, or needs analyses to specify the content of assessment items, tasks, or discourse; to align the assessment with curriculum standards or

educational or job requirements; or to meet the expectations of users of assessment information (e.g., teachers, students, program administrators, parents, or employers);

- *construct representation*, using task or discourse analysis, observations, or surveys to ensure that the tasks or materials in an assessment elicit the intended behaviors, correspond to predicted difficulty or performance levels, and are not influenced unduly by construct-irrelevant factors or unfairness to differing populations;
- *consistency among measures*, using statistical analyses of scores to establish their reliability within an assessment or sections of it, over successive administrations and versions of the assessment, and over time, among raters or other (e.g., automated) scoring methods, and across other assessments of similar abilities; ensuring that the scores correspond to hypothesized abilities and difficulty levels and are not influenced unduly by construct-irrelevant factors;
- *criterion-related evidence*, comparing results of an assessment to relevant criteria such as other related tests, self-assessments, teacher or employer assessments; performance evaluated in courses, at work, or in relevant societal contexts; or in predicting individuals' long-term success; and
- *appropriate consequences*, determining the effects of using an assessment on institutional systems (e.g., schools, universities, or immigration policies) or the activities of stakeholders or materials related to the assessment (e.g., teachers, students, study or curriculum materials), ensuring that information from and about the assessment is used appropriately and that the impact of the assessment, if any, is desirable rather than undesirable in relation to the construct of the assessment.

Defining Language Abilities for Assessment Purposes

Despite agreement on the centrality of construct definition in validity research, the relations remain tenuous between language testing and theories of language acquisition (Bachman & Cohen, 1998). Early theorists of language testing, such as Lado (1961), assumed (with limited theoretical or empirical justification) that knowledge of grammar and vocabulary was a central construct to be assessed along with brief samples of students reading, listening to, speaking, and writing the language assessed. Subsequent efforts to design language assessments on the basis of more comprehensive theories of communicative competence produced more authentic or educationally relevant tasks, but were challenged to provide firm empirical evidence that their assessments could do justice to either the full scope or the integral essence of these theories of language proficiency (Harley, Allen, Cummins, & Swain, 1990). These challenges arise from the enormous range of individual, sociolinguistic, psychological, situational, and crosslinguistic factors that produce variability in the performance of communication tasks as well as the acquisition of core features of the numerous, interrelated micro-systems of L2s—as demonstrated in much systematic research into the development of L2 proficiency.

Indeed, the complexity of languages, communication, learning, and social contexts defies the straightforward specification of constructs of language abilities for assessment purposes. Nonetheless, any language assessment is obliged to adopt certain theoretical stances on the nature of language abilities. For instance, Read and Chapelle (2001) have demonstrated how tests of L2 vocabulary—just one aspect of language ability—may conceptualize vocabulary as either a trait (a characteristic possessed by a person), a behavior (specified by performance in a context), or an interaction (between a person's abilities and a context). Mislevy and Yin (2009) have likewise argued for an interactionist perspective to account for the complexity and adaptability of languages, human abilities, and social contexts, arguing that most conventional language assessments have been based on trait theories (which offer limited information on individual performance within the context internal

to a test rather than extending to abilities to communicate in other circumstances). These theoretical orientations shape the inferences that can be made from results of a language assessment, and consequently their validity (i.e., either internal to the conditions of the test or extending to other contexts). The validity of oral interviews as a method of language assessment, for instance, has been challenged for restricting opportunities for interpersonal communication or lacking bases in theories of communication or language acquisition (Johnson, 2001) as well as for lacking empirical verification of commonsense aspects of language performance such as “fluency” (Fulcher, 1996).

For these reasons, demands for the validation of a language assessment are shaped by the intended purposes for assessment as well as the conditions that are practically feasible for conducting it. Differing demands for validation arise depending on whether language assessments serve the interests of pedagogy, research, or institutional policies and whether they serve such functions as selecting (e.g., into programs, groups, or employment), monitoring (e.g., diagnosis to inform teaching and learning, evaluations of programs or institutional systems), or certifying abilities or achievement (e.g., professional licensure, program completion, course grades, or differences of interest within research studies).

For instance, portfolio assessments can provide considerable information about individuals’ abilities to compose over multiple experiences in a broad variety of tasks, and so are useful for teachers (and students) to diagnose the needs of individual students, to monitor their long-term achievements, and to assign grades within a specific course or program. In effect, the context of the course and its learning and teaching opportunities implicitly set local, informal standards for validation. But the time and expense required to produce and then evaluate a whole portfolio of writing are not realistic for high-stakes tests involving large, diverse populations across a range of contexts, and the conditions for doing so could not be standardized or validated in a way that is efficient or fair for high-stakes purposes such as decisions about university admissions or immigration. In contrast, for research on language learning, metalinguistic judgment tasks may provide efficient standardized data about people’s knowledge of the grammar of a language, but they require extensive theoretical justification, pilot development, and verification to ensure the validity of assessment instruments and procedures, and their scores are not intended to extend to inferences about abilities to communicate generally, and so are seldom used for pedagogical or policy purposes.

Validation for Language Education Practices

For educational practices, the widespread adoption of curriculum standards or frameworks around the world has led to new challenges for the validation of language assessments within and for educational programs. At the macrolevel of educational systems, most jurisdictions have produced or adopted policies, on the basis of professional consensus and related inquiry (Brindley, 1998; North, 2000; Fulcher, 2008; Cumming, 2009), that define progressive levels of language proficiency expected within educational programs. These initiatives follow principles of criterion-referenced assessment, aiming to link directly curriculum resources, teaching practices, and expected learning outcomes on a regional, national, or international basis.

As a consequence, assessments used for selection, placement, achievement, or program completion require validation in reference to the particular curriculum framework as well as the participating learner populations and the learning opportunities provided to them. Numerous initiatives with diverse approaches to validation have been undertaken in reference to the Common European Framework of Reference for Languages (CEFR). For instance, the Council of Europe (2009) describes a range of validation methods to benchmark new and existing language tests to the categories and levels of the CEFR. Alderson

(2005) advocates an approach to standard setting for the validation of diagnostic self-assessments with the DIALANG project, anticipating great situational, individual, and interpretive variability. Similar initiatives in other settings have also emphasized the importance of teacher development in assessment practices to ensure standardization on the local basis of pedagogical practices, for example, with the Certificates in Spoken and Written English in Australia (Brindley, 2000) or the Teachers of English to Speakers of Other Languages (TESOL) Standards in the USA (TESOL, 2001). From the micro-perspective of teaching practices, as well, innovative approaches have appeared for teachers to validate their ongoing assessments of students' learning and achievements systematically in classroom contexts and through collegial collaboration (Davison & Leung, 2009).

Prevailing Concerns

Theoretical and methodological frameworks for validation research are now well articulated, confirming the centrality of validation to language assessment. What remain to be addressed, however, are applications of these frameworks to a broad range of assessment practices. Four constraints prevail. First, extensive resources and expertise are required to validate language tests systematically and rigorously. Not only are long-term commitments to specialized research required, but also the outcomes of such research need to be incorporated meaningfully into ongoing refinements to assessment instruments, procedures, and uses. To date, just a few high-stakes tests of English such as TOEFL and IELTS or certain national or state exams have been able to afford the expense and employ the specialized technical expertise for rigorous validation research. Moreover, even for these few tests, once test formats, score scales, and methods of score reporting have been established as policies at institutions such as schools, universities, or governments, it is a challenge to alter them in a way that readily incorporates, on an ongoing basis, results from validation research. That is the second constraint: Institutional policies, testing practices, and stakeholder attitudes value consistency and resist change, making it difficult for validation research to be incorporated significantly into refining established language tests in ways that could alter their conventional uses.

The third constraint concerns applying principles of validity broadly and routinely to educational and other informal assessment practices. Many language assessments are made on a local or even individual basis, either as an ordinary part of teachers' monitoring of students' performance learning in classes or at a program level for placement into or to certify completion of a course or program. The introduction of curriculum standards over the past decade has certainly helped to make explicit and to standardize criteria, procedures, and reporting for informal language assessments (and self-assessments). But the validity is uncertain for language assessments developed and administered by individual teachers, in a strict or official sense, because these may involve implicit or unarticulated pedagogical purposes and are open to numerous sources of variance. Moreover, current programs for initial teacher education (or even ongoing professional development) seldom focus on language assessment in the depth required for practicing educators to learn how to conduct validation research systematically, and most teachers' working conditions do not permit the time to do it.

The fourth constraint, already described above, concerns the limited congruence between theories of second language acquisition (SLA) and practices of language assessment. All language assessments make assumptions about language development and performance, but these assumptions are seldom articulated systematically as constructs or evaluated rigorously in ways that really provide support for them. Generally, there is little agreement on theories of language acquisition for assessment purposes or, fundamentally, even

whether language abilities should be assessed as a trait, behavior, or interaction in any given situation. Moreover, it is unlikely that a single theory of language learning could emerge or be applied uniformly as a useful construct across different language assessments given the enormous variation in languages themselves and their status in different societies, the conditions under which languages are taught, learned, and practiced, and the many, divergent purposes and populations for which language assessments are made.

Validity in Qualitative Research

ADRIAN HOLLIDAY

Qualitative research is a mainstream social science methodology which looks deeply at instances of social life which are difficult to see with more quantitative surveys and experiments. As in other areas of professional research, qualitative research has had to struggle for recognition in applied linguistics largely because of perceived issues with validity and also because there are other available methodologies connected with linguistic analysis. However, in the past 15 years it has become established in applied linguistics and has been put to use in a wide range of areas from classroom research to the social nature of language education and the broader social underpinnings of the use of language in society (Richards, 2009, pp. 155–7). This entry first looks at the context of the validity issue within qualitative research and then describes how validity is ensured.

Context of Validity in Qualitative Research

Qualitative research is not as “unstructured” and unscientific as it is often depicted to be. It follows the basic standards of validity which underpin all social science and perhaps science generally. These standards concern the management of variables in such a manner that subjectivity is reduced. In social research this concern is especially focused because of its human nature; and the task is considerable in qualitative research because of its necessary engagement with subjectivity. It is “a situated activity that locates the observer in the world” and “turn[s] the world into a series of representations” (Denzin & Lincoln, 2005, p. 3). It is therefore impossible to remove completely the influence of the researcher or to see what is being studied in any “pure” or “untouched” form. The task is therefore to find ways for describing the researcher’s engagement with the world in such a way that it is made transparent and accountable. In more quantitative areas of social research the task of reducing subjectivity may be easier because statistical devices can be used to mediate between the researcher’s bias and the data; but finally the researcher still has to interpret the data and the issue of subjectivity is still there. In qualitative research there are no such statistical devices and the relationship between researchers and what their subjects say and do is more direct. The management of subjectivity therefore becomes a major preoccupation in maintaining validity, and has to be engaged with at almost every stage of research design, the analysis of data and the writing of the research study. Hence, with a postmodern realization of the uncertain nature of knowledge, in qualitative research there is a new “crisis of representation” in which “issues such as validity, reliability, and objectivity, previously believed settled” are “once more problematic” (Denzin & Lincoln, 2005, p. 18).

The task is made more problematic because of the varied, creative, and complex nature of qualitative research. There is the potential to “deploy a wide range of interconnected interpretive practices, hoping always to get a better understanding of the subject matter at hand” (Denzin & Lincoln, 2005, p. 4). These might include a wide range of possible types of data. While what people say in interviews, conversations, or longer statements, is perhaps the most common, what they write, photograph, film, draw, paint, post, build

2 VALIDITY IN QUALITATIVE RESEARCH

and so on, where they go, what they wear, who they associate with, avoid or shun, the wide range of their nonverbal interaction, can also be of interest, and can be captured in visuals, documents, art forms, and other artifacts of social life, as well as descriptions written by the researcher (Holliday, 2007, pp. 62–3). These choices relate to the nature of the research setting as it is revealed. There are also many subdisciplines which cover this huge range of possibilities, such as ethnography, grounded theory, phenomenology, narrative enquiry, and auto/biography, which draw from a broad pool of common principles and practice but may also manage data in different ways.

It may indeed be said that qualitative researchers can, or indeed should, collect whatever evidence they need, in whatever manner they can, from the social world to get to the bottom of what they are investigating. While research questions can be very varied, they can be as simple or as complex as “what is going on in/when/where.” Principles of validity therefore need to be sufficiently deep to apply to a wide range of possibilities.

Coming Out

A number of attempts at ensuring validity which have been copied from more predictable quantitative research methods have been unsuccessful. A common example of this is taking what has been termed a postpositivist approach and trying to apply the same principles of representativeness as might be employed in a survey. The outcome is often a superficial use of interview in which the same questions are asked to a large “sample” of people, the “responses” are reported as “results,” and the subjectivity and intervention of the researcher is largely and naively ignored. Another example is trying to increase accountability by tying down research procedures to a prescribed step-by-step method. Action research, grounded theory, and phenomenology are common targets, as they succumb to the requirements of professional bodies, and, as a consequence, lose the broad depth of application for which they are designed. The result is that “qualitative analysis will only appear as bad quantitative research” (Miller, Nelson, & Moore, 1998, p. 401, citing Athanasas & Heath, and Nielsen).

To overcome this bad press, qualitative research therefore needs to engage fully with the inevitability of subjectivity and researcher intervention for its full power to be realized and for realistic principles for validity to be developed. Achieving this requires a change in research paradigm. A postpositivist adherence to the principles of quantitative research needs to be left behind in exchange for a full adoption of what has been variously termed an interpretivist or a postmodern approach (Clifford, 1986; Hammersley & Atkinson, 1995; Gubrium & Holstein, 1997; Denzin & Lincoln, 2005, p. 11). It is acknowledged that researchers cannot help but interact with the social worlds they study, and that they bring their own ideologies to this interaction. Scientific rigor therefore resides in the manner in which researchers manage their subjective engagement with the world around them.

Rather than claiming validity on the basis of objectivity, postmodern qualitative researchers thus need to provide detailed justification for how their choices of research design suit the specificities of the social setting and the researcher–subject relations which they generate. This does not mean that there is no room for the concept of objectivity. It must, however, be treated as an ideal which is unattainable, but which must nevertheless be sought after and aimed for. The key to validity therefore is in providing a close, and indeed, as far as is possible, objective account of the decisions made by the researcher to “show the workings” of every stage of the research process (Holliday, 2007), the procedures for which a description now follows.

Choice of Setting and People Involved

Researchers need to choose where or with which group of people to carry out their studies on the basis of the richness of the data which can be obtained with the purpose of finding deeper meanings. It has to be possible to form a thick description, which is the process of building complex pictures of what is going on from interconnected pieces of diverse data; and it is making these interconnections that form the basis of strong analysis (Geertz, 1993, p. 6; Holliday, 2007, pp. 74–87). Choices in this regard may be opportunistic, depending on where the researcher is able to obtain access. This opportunism must also be carefully cataloged and rationalized.

Researcher Influence and Bias

It is crucial that researchers assess the impact that they are likely to be having on the people involved in the study and what is therefore done to manage this. This will necessitate a high degree of reflexivity in looking into their own personal, academic, or professional prejudices so that they may account for, or “bracket” them (see Schutz, 1970). In this respect it is important to note that even interview data, which has often been considered to contain relatively reliable representations of what people think, is going to be more “symptomatic” of their particular “relationship to the topic and the interview context than about the topic being discussed” at a particular moment in time, as a result of co-construction with the researcher (Block, 2000, pp. 758–9). There is also discussion about the varied meaning making in the choice of something as seemingly technical as different transcript styles (Bucholtz, 2007). More generally, it needs to be acknowledged that all qualitative data, in the way in which it is selected, organized, and presented, is “something fashioned” by the researcher and will construct realities in different ways (Geertz, 1993, p. 15).

There will thus be particular issues with teachers researching teachers or teachers researching students, where there are professional relationships which will influence what happens and what is said. All researchers also need to appreciate that how they approach, see, and interpret what they are researching will be influenced by their own academic discourses and the academic politics which underpin them (Kuhn, 1970). The discipline of bracketing is associated with the further important discipline of making the familiar strange—to enable even the insider researcher to notice the workings of social life as though through the eyes of a stranger. Thus, the first thing a teacher must try hard to do, when researching classrooms or anything to do with students, other teachers, or pedagogy, is to stop thinking like a teacher and to think of students and teachers more basically as people. Qualitative researchers must therefore be highly disciplined in the manner in which they look at social life, and be able at least to understand the importance of standing outside familiar discourses.

Connected to this is using the first person as a device for showing a “more transparent relationship with her readers” by making it “very clear what her own opinions are” and not disguising “opinion” as “fact” (Clark & Ivanič, 1997, p. 169), thus acknowledging that it is the agency of the researcher as writer that makes the research (Richardson, 1994, p. 518).

Allowing the Unexpected

Given the irrevocable influence and bias of the researcher, the validity of any study will depend on the steps taken to allow the unexpected to emerge. This is why the tight post-positivist sequence of individual interviewees’ answers to individual interview questions,

4 VALIDITY IN QUALITATIVE RESEARCH

referred to above, must be broken. The classic way to do this is to employ a holistic analysis in which themes are allowed to emerge from across the data set, from the broad cultural nature of the social setting or the people being studied as represented by the thick description. The sign of good research is therefore when the data takes researchers to places they had not imagined.

Getting From Analysis to Writing

Because the reporting of qualitative research comprises a text which is constructed by the researcher, it is necessary to explain the origins of the structuring of this discussion. In the classic qualitative research design, the data is discussed under the thematic headings which emerge from the analysis. It is important to note here that in a qualitative study there is not normally a presentation of the data before the discussion as would be expected in a quantitative study. The reason for this is that the presentation of qualitative data is not possible without a discussion *because* of its subjective nature. The thematic headings are instrumental therefore in structuring the discussion which underpins the presentation of the data. Hence, validity depends on the transparency with which these thematic headings are determined through the process of analysis.

Appropriate Claims

The inherent subjectivity of qualitative research means that it can only be valid if it does not pretend to be something else. It would therefore be inappropriate for a qualitative study to claim any form of statistical significance. Because each study looks deep at a particular instance of social life, evidence of the spread of a social phenomena based on qualitative research can only be achieved through a large number of studies which, when put together, build a gradual picture of the world. At the same time, qualitative studies cannot be replicated, as the nature of the data they collect is very specific to the circumstances in which it is collected. A qualitative study must therefore be very cautious about the claims that it makes. A powerful contribution which it is able to make is to throw caution on established positions by means of a deep and highly detailed close reading of a particular case.

The Difficulty With Writing

It becomes clear that much has to be explained in a qualitative study if its validity is to be demonstrated. This, together with the need to present sufficient examples of data to demonstrate thick description, means that it is hard to fit all that is necessary into the average sized journal article (Richards, 2009, p. 161). A further difficulty with writing qualitative studies is that nothing is ever straightforward. The need for researchers to navigate sensitive pathways between their own subjectivity and the probability of certainty make not only the business of sense-making extremely difficult, but also require immense subtlety of expression in the writing of the study. A research student almost failed because he did not make it sufficiently clear that what he saw in his data was different to what his examiners saw. Readers cannot be left alone with data. They need to have things pointed out to them. Data left by itself in the text may not be sufficient to exemplify what the researcher perceived to be going on at the time when it was collected. The intricacies of the thick description have to be explained by pointing to what needs to be connected with what. "Moving from the field to the text to the reader" is central to the whole

qualitative research process in which “interpretation requires the telling of a story, or a narrative that states ‘things happen this way because’ or ‘this happened, after this happened, because this happened first.’” Hence, “the problems of writing are not different from the problems of method or fieldwork” (Denzin, 1994, pp. 500–1, citing Clough).

Checklists for Validity

In summary, the validity of any particular qualitative research study can be assessed by the degree to which there is a reflexive acknowledgment of the issues surrounding, and an accountable strategy for managing (a) the choice of research setting or group of people upon which the study will be focused, with regard to the potential richness of data and thick description; (b) the subjectivity, presence, and influence of the researcher and the manner in which the study is therefore constructed; (c) space for the unexpected to emerge, for the data to speak beyond the initial structuring of the research questions; (d) the relationship between the analysis of the data and the presentation and construction of its discussion; and (e) claims which are appropriate to the scope and design of the study. Finally, the study should be written in such a way that (f) all of these issues are seen to be addressed and with (g) clear articulation of how the data speaks.

Much can be gained from the explicit management and expression of these areas in satisfying the more macro criteria for validity referred to by Richards (2009, p. 159, citing Lincoln & Guba). *Credibility* is achieved when the relationships between researchers, data, design, and appropriate claims are laid out for scrutiny and makes sense. *Transferability* becomes possible when other researcher can learn from how the issues of subjectivity are addressed in a particular study. The *dependability* of the study is based on knowledge of the professionalism applied by the researcher to address these issues. *Confirmability* “depends on making the data available to the reader, and this in turn depends on *transparency* of representation” (Richards, 2009, p. 160)—once again emphasizing the need for the researcher to show the detail of how specific extracts of data lead to specific claims.

It is helpful to consider three principles by which qualitative researchers can monitor the validity of their interpretation (Holliday, 2007, pp. 94, 109). *Submission* requires that researchers work hard to hear what the data says even if this goes against their initial agendas for the study. It *must* be a real outcome that even the ideology of the researcher is overturned. *Emergence* of the unexpected from the data is thus allowed. *Personal knowledge* enables the researcher to judge what makes sense or sounds right. This must not be confused with “insider knowledge”; and it can only result from working hard to recognize and put aside prejudice. It is knowledge based on, as far as is possible, a nonaligned experience of how social life operates, which can be applied to *any* set of circumstances. This is expressed well by Blackman (2007, p. 711), in his account, employing his broad “ethnographic experience” in his study of young women.

What Is Possible

A useful approach to validity in qualitative research has been to seek for higher level strategies which can be applied to a wide range of research practices and approaches. This enables massive potential in what researchers are able to do to get at the often hidden realities which they wish to investigate. It is therefore paramount that there should not be a narrow list of types of data and equally narrow guidelines for how to collect and analyze them. It needs to be possible for researchers to move into ever more adventurous and creative modes of collecting the evidence that they need. The use of fictionalized ethnographic reconstructions, to capture diverse experience which stands outside the possibility

of more traditional data forms, is a case in point (Holliday, 2004; Inckle, 2010), or using past professional experience as data (Holliday, 2005). The important point is that, however the individual researcher chooses to proceed, the choices made and the claims made must be governed by the same broad principles of validity.

Validity: Mixed Methods

NANCY L. LEECH AND AMY DELLINGER

For applied linguistics researchers, validity is an important concept to consider and assess in all research studies. Unfortunately, there is currently limited guidance for assessing validity for applied linguistics researchers who conduct mixed methods research. In general, research validity can be defined as being

not about singular truths, and it certainly is not limited to quantitative measurement; rather, by validity we mean that a research study, its parts, the conclusions drawn, and the applications based on it can be of high or low quality, or somewhere in between. (Onwuegbuzie & Johnson, 2006, p. 48)

It is important for applied linguistics researchers to consider research validity in all studies because the level of quality of the study directly relates to how well one can trust the conclusions and apply the information to other scenarios.

Early work in the area of validity in mixed methods research treated the qualitative and the quantitative components separately (e.g., Krathwohl, 1993; Newman & Benz, 1998). Because mixed methods research, when done well, integrates the qualitative and quantitative components of the study, validity for mixed methods research is in a class of its own and is still in its infancy (Onwuegbuzie & Johnson, 2006). Yet, in regard to validity in mixed methods research, “validity has become a catchall term that is increasingly losing its ability to connote anything. When a term is used with other words to connote so many meanings, it essentially has none” (Tashakkori & Teddlie, 2003, p. 36). Furthermore, Teddlie and Tashakkori (2009) believe “there is a dearth of systematic literature on the quality (and transferability) of inferences in [mixed methods] research” (p. 300). This scarcity of information regarding validity in mixed methods studies is exemplified in the second edition of the *Sage Handbook of Mixed Methods in Social and Behavioral Research* (Tashakkori & Teddlie, 2010) where only one chapter (O’Cathain, 2010) specifically addresses validity in mixed methods research. Thus, the purpose of this entry is to present the available frameworks for understanding validity in mixed methods research. Hopefully this information will assist researchers in better understanding and using the concept when conducting mixed methods studies.

Currently there are seven available conceptualizations/frameworks for applied linguistics researchers to increase their understanding of validity in mixed methods research studies. These include using concept mapping (Caracelli & Riggan, 1994), integrative framework for inference quality (Teddlie & Tashakkori, 2009), typology of mixed methods legitimation (Onwuegbuzie & Johnson, 2006), the validation framework (Dellinger & Leech, 2007), good reporting of a mixed methods study (GRAMMS; O’Cathain, Murphy, & Nicholl, 2008), identification of threats to validity and how to minimize these threats (Creswell & Plano Clark, 2010), and a quality framework (O’Cathain, 2010). Each of these conceptualizations/frameworks will be delineated in the order in which they were published. This is important to consider, as the field of mixed methods research is still evolving (O’Cathain, 2010; Teddlie & Tashakkori, 2009). Thus, many of these frameworks build upon the others, and therefore have components that are similar along with additional new views of assessing validity in mixed methods studies.

Caracelli and Riggin's (1994) Model for Validity

The earliest approach to understanding validity in mixed methods research studies was published by Caracelli and Riggin in 1994. These authors hoped to "inform practice by depicting how social science researchers conceptualize a quality mixed-method evaluation, rather than to set forth standards" (Caracelli & Riggin, 1994, p. 140). First, these authors asked their colleagues to help them identify criteria for validity in mixed methods research studies. From this request, 94 items were identified, with 20 being specific to mixed methods research studies. Using concept mapping all 94 items were then sorted and mapped into clusters which represented domains: a total of four domains were identified. The domains included: (a) design (i.e., the adequacy of the sampling and measurement issues); (b) data quality and analysis (i.e., the appropriateness of the analysis, how missing data were handled, the response rates, and the reliability and validity of the data); (c) bias (i.e., actions the researcher takes to assess the effects of bias in the study); and (d) interpretation (i.e., the interpretation of the findings, including "weighting inferences based on the adequacy of measurement . . . and dependability of evidence") (Caracelli & Riggin, 1994, p. 148). Applied linguistics researchers should pay attention to these concepts, especially the concept of bias. For example, in an applied linguistics study researching whether all children should learn a foreign language, if the researcher learned to speak a foreign language as a child, then they may be biased toward children learning a foreign language. If this bias is not identified and the effects on the results assessed, then the findings of the study may not be trustworthy.

Integrative Framework for Inference Quality

Teddlie and Tashakkori's (2009) *integrative framework for inference quality* is regarded by many researchers as the most comprehensive approach to evaluating the validity of mixed methods research. These authors began developing their framework in 2003 (Tashakkori & Teddlie, 2003), and over the years have continued to expand it (Tashakkori & Teddlie, 2008). More recently, Teddlie and Tashakkori (2009) have begun using the term "inference quality," which can be defined as a combination of design quality (i.e., whether the study adheres to best practice) and interpretive rigor (i.e., how well the results can be trusted). According to these authors, specific criteria should be evaluated to assess the strength of the inference and should be used at each step of a mixed methods study. There are two elements to the framework: design quality and interpretive rigor. When assessing design quality the following should be included: (a) design suitability (i.e., the appropriateness of the design for the content being studied); (b) design adequacy/fidelity (i.e., the adequacy of the design for the content being studied); (c) internal design consistency (i.e., how well the qualitative and quantitative components of the design fit together); and (d) analytic adequacy (i.e., assessing the data analysis techniques and whether they can provide adequate results). When evaluating interpretive rigor, a researcher should assess the following: (a) interpretive consistency (i.e., the interpretations of the data should "closely follow the relevant findings in terms of type, scope, and intensity") (Tashakkori & Teddlie, 2009, p. 301); (b) theoretical consistency (i.e., interpretations should be consistent with theory); (c) interpretive agreement (i.e., how likely are other researchers to arrive at the same interpretations); (d) interpretive distinctiveness (i.e., interpretations that are arrived at are more credible than other possible interpretations); (e) integrative efficacy (i.e., how consistent are the interpretations between the qualitative and quantitative components); and (f) interpretive correspondence (i.e., how well the interpretations relate to the purposes and questions of the study). For the applied linguistics researcher, these concepts

are important to consider, as applied linguistics research studies should be well-designed and the findings should be trustworthy. For example, when investigating which languages should be used in courts, knowing whether the results of the study are trustworthy and if the study adhered to best practice would affect whether or not the results should be acted upon.

Typology of Mixed Methods Legitimation

In 2006, Onwuegbuzie and Johnson developed a new framework for understanding validity in mixed methods research. Building upon Tashakkori and Teddlie's (2006) treatment of validity in mixed methods research, these authors created what they titled the *typology of mixed methods legitimation*. These authors used the term "legitimation" instead of validity because they felt the term validity was too closely associated with the quantitative research paradigm, and legitimation was closely tied to the qualitative research paradigm. Legitimation is defined as "the difficulty in obtaining findings and/or making inferences that are credible, trustworthy, dependable, transferable, and/or confirmable" (Onwuegbuzie & Johnson, 2006, p. 52). Onwuegbuzie and Johnson's (2006) typology of mixed methods legitimation incorporates nine types of legitimation. First is *sample integration legitimation*, which is how well the qualitative and quantitative sampling increases the overall interpretation. *Inside-outside legitimation* can be defined as how well the researcher presents the participants' and the researcher's viewpoints. Inside-outside legitimation is an important concept to consider in applied linguistics research, especially for research studies with participants who speak languages other than the researcher's first language. *Weakness minimization legitimation* is the possible weaknesses of one component, either qualitative or quantitative, being minimized by the strengths of the other component. *Sequential legitimation* is where the inferences are affected by the sequence of the components, qualitative and quantitative, in the study. *Conversion legitimation* occurs after quantizing or qualitzing data if the interpretations are affected. *Paradigmatic mixing legitimation* occurs when issues arise from "competing dualisms: epistemological (e.g., objectivist versus subjectivist), ontological (e.g., single reality versus multiple reality), axiological (e.g., value-free versus value-bound), methodological (e.g., deductive logic versus inductive logic), and rhetorical (e.g., formal versus informal writing style) beliefs" (Onwuegbuzie & Johnson, 2006, p. 59). *Commensurability legitimation* is the extent to which the researcher can switch back and forth from using a qualitative lens to the quantitative lens. *Multiple validities legitimation* is the extent to which the validity/legitimation of the different components is achieved. Finally, *political legitimation* includes the conflicts of ideological values from combining qualitative and quantitative components. Through utilizing the typology of mixed methods legitimation (Onwuegbuzie & Johnson, 2006) model, the researcher can better assess how well the mixed methods design and inferences are integrated.

Validation Framework (VF)

In 2007, Dellinger and Leech presented their validation framework (VF) for assessing validity in mixed methods research. Working from Messick's (1989, 1995) and Cherryholmes' (1988) ideas about construct validity, the VF is a holistic framework to guide evidence accrual necessary for assessing construct validity. Here, validity is defined as the meaning that accrues to data (whether qualitative or quantitative) through all aspects of the research process, including preparation activities (e.g., literature review, study planning), through use, and consequences of use. According to Dellinger and Leech (2007, p. 321):

4 VALIDITY: MIXED METHODS

The application of construct validation to mixed methods research is appropriate because (a) construct validation is a pragmatic process (Cherryholmes, 1988); (b) construct validation requires mindfulness (Langer, 1989), recognition, and the constant integration of relevant available information, whether qualitative(ly) or quantitative(ly); (c) construct validation assumes that there are no criteria or rulers to measure research quality except as determined by discourse and language in a community of researchers (Cherryholmes, 1988) and the subsequent weight of the research in the negotiations of data meaning; and (d) construct validation is a non-ending, continuous, time- and context-specific, open process (Markus, 1998; Messick, 1995; 1998).

The VF incorporates five elements: (a) the foundational element; (b) the elements of construct validation for quantitative, qualitative, and mixed research; (c) inferential consistency; (d) the utilization/historical element; and (e) the consequential element. According to Dellinger and Leech (2007), the foundational element provides validity evidence through the evaluation of extant literature and/or acknowledgment of prior knowledge or perceptions. The foundational element has implications for the applied linguistics researcher; if the extant literature and/or the researchers' biases are not well-known and described in a research report, it is difficult to assess how the study adds to the literature and whether the results are meaningful. The separate elements of construct validation for quantitative, qualitative, and mixed research refers to the importance of considering the different types of validity evidence, including traditional qualitative and quantitative validity sources, as well as the more recent approaches mentioned in this entry to obtain validity evidence specific to mixed methods (e.g., legitimation). Inferential consistency provides validity evidence through logical consistency of the design, the research literature, types of measurement, and analytic choices. The utilization/historical element illustrates how validity evidence is provided by the use of inferences and data. Finally, the consequential element focuses on how data use and inferences have consequences that impact the validity or meaning accrued to data. Applied linguistics researchers can find examples of how to use the validation framework to evaluate mixed methods studies from a variety of research areas in Leech, Dellinger, Brannagan, and Tanaka (2010).

Good Reporting of a Mixed Methods Study (GRAMMS)

O'Cathain, Murphy, and Nicholl (2008) developed the *good reporting of a mixed methods study* (GRAMMS) based on Creswell's (2003) issues to consider when conducting a mixed research study. After identifying and analyzing 75 mixed research articles from the fields of health, social science, and education, these authors found a lack of transparency in the reports. Thus, GRAMMS was developed to assist researchers in their discussions of mixed research studies. GRAMMS includes the following guidelines: (a) justify why the research question(s) should be answered with a mixed research study; (b) include the "purpose, priority and sequence of methods" (O'Cathain, Murphy, & Nicholl, 2008, p. 6) when discussing the design; (c) include information on sampling, data collection, and analysis; (d) include where, how, and who participated in the integration; (e) discuss limitations of "one method associated with the presence of the other method" (O'Cathain, Murphy, & Nicholl, 2008, p. 6); and (f) report insights that stemmed from integrating methods. The first step in GRAMMS can impact the research of an applied linguistics researcher. For example, if the researcher were to investigate three types of language instruction to assess whether one was better than the others, it would be paramount for the researcher to address why this type of research question should be answered through a mixed methods study.

Creswell and Plano Clark's (2010) Model for Assessing Validity

More recently, Creswell and Plano Clark (2010) outlined a model for assessing validity in mixed methods research through evaluating threats to validity, and included methods of minimizing these threats. These authors chose to focus "on the strategies that researchers might use in all three of the phases of data collection, data analysis, and interpretation of research" (p. 239) and to include the importance of conceptualizing the validity issues in relationship to the research design. Thus, Creswell and Plano Clark (2010) present threats and methods of minimizing threats in two sections: one for merging data in concurrent/convergent/embedded/transformational/multiphase designs and one for connecting data in sequential/explanatory/exploratory/embedded/transformational/multiphase designs. Each section includes the three areas of data collection, data analysis, and interpretation. An example of a threat for data collection when merging data is sampling inappropriate participants for the qualitative or quantitative components. Their suggested method of minimizing this threat is to sample from the same population for both components. When merging data in the data analysis area, these authors present an example threat of conducting statistics with quantitized qualitative data that are not appropriate. Their suggestion for minimizing this threat is for researchers to be sure to analyze distributions of the data and to conduct nonparametric statistics if non-normal distributions appear in the data. We would add the importance of checking other assumptions (e.g., independence of data, linear relationships, etc.), as well. Finally, an example that Creswell and Plano Clark (2010) include for a threat when merging data in the interpretation area is finding divergent results and not resolving them. For example, in applied linguistics research on languages that are no longer being used anywhere in the world, if conflicting results from the data were identified, then this conflict would need to be addressed in order for the results to be trustworthy. When this threat occurs, these authors suggest that researchers could collect more data, reanalyze the present data, and/or check the procedures that were used to collect the data. According to Creswell and Plano Clark (2010), "Researchers should actively use strategies to minimize the validity threats in their studies and also discuss the limitations of the study's design as part of the larger interpretation of the study" (p. 243).

O'Cathain's (2010) Quality Framework

The last framework, and most recent, is O'Cathain's (2010) quality framework. Building upon Teddlie and Tashakkori's (2009) integrative framework for inference quality, and using Caracelli and Riggan's (1994) domains of quality, the quality framework incorporates the work of Creswell (2003), Creswell and Plano Clark (2007), Caracelli and Riggan (1994), Datta (1997), Dellinger and Leech (2007), Onwuegbuzie and Johnson (2006), O'Cathain, Murphy, and Nicholl (2008), Pluye, Gagnon, Griffiths, and Johnson-Lafleur (2009), Teddlie and Tashakkori (2009), and Tashakkori and Teddlie (2003, 2008, 2009). The quality framework is delineated by the stage of the study: (a) planning, (b) undertaking, (c) interpreting, (d) disseminating, and (e) application in the real world. The domains of quality (planning quality, design quality, data quality, interpretive rigor, inference transferability, reporting quality, synthesizability, and utility) are mapped onto the stages of the study. Within each domain are items, including definitions of the items and the source, which would be included in that domain. For example, under the planning stage of the study, the domain is planning quality. The items within the domain of planning quality include: (a) foundational element (Dellinger & Leech, 2007), (b) rationale transparency (Caracelli & Riggan, 1994; Creswell, 2003), (c) planning transparency (Creswell, 2003), and (d) feasibility (O'Cathain, Murphy, & Nicholl, 2008). Each of these items includes a brief definition. O'Cathain (2010)

acknowledges that there are many criteria in the quality framework, how to assess the individual parts is not clearly articulated, and there are competing criteria in the framework: thus, the author stresses that the framework is a work in progress and will evolve over time.

These seven frameworks/models represent early thinking about validity in mixed methods research studies and should be helpful for applied linguistics researchers. When conducting a mixed methods research study in applied linguistics, any of these frameworks can be utilized, as each brings different concepts and views to the fore. It should be noted that the field of mixed methods research is still evolving (O'Cathain, 2010; Teddlie & Tashakkori, 2009), and thus, as noted throughout this entry, many of these frameworks build upon the earlier frameworks. As with all other research, it is important to consider validity evidence when conducting mixed methods research so that studies are rigorous and results and inferences are defensible.

Values in Language Assessment

TIM MCNAMARA

Language assessment can be understood from many different viewpoints. The conventional perspective focuses on the individual candidate—determining the level of skill and knowledge in each individual taking the test. The quality of the information about individuals that the test is capable of yielding is investigated using statistical (psychometric) and other procedures. This represents a cognitively based approach. An alternative perspective, in which there is growing interest, but which faces some resistance, involves asking, “Whose values are represented in the test, and whose interests are advanced through its existence and operation?” This perspective recognizes that testing is a social and political practice, and that disputes over the reasonableness of tests may act as sites of contestation of social values. Appropriate methodologies for considering the values embodied in language tests will include a range of qualitative methodologies, but also intellectual sources in which language-testing researchers are seldom trained, such as policy analysis, social theory, and so on. Moreover, from this point of view, even the relative technical quality of a test can be seen in a different light: technically sophisticated tests often make the values implicit in tests harder to recognize, as many people believe that a procedure which is “scientifically” developed, and whose validation makes use of the great conceptual and technical sophistication available from modern psychometric theory, must thereby be fair.

However, a more careful look at validity reveals a great deal more than a means for scientific development of tests. The most influential explanation of validity was articulated in the classic paper by Messick (1989). Messick sets out four broad areas of validity, in the form of a matrix, and in it he gives a special place to the values implicit in tests. The concepts contained in Messick’s validity framework have been glossed by McNamara and Roever (2006) as shown in the matrix below.

	Test interpretation <i>(what test scores are assumed to mean)</i>	Test use <i>(when tests are actually used)</i>
Evidential basis <i>(using evidence in support of claims)</i>	Construct validity <i>What reasoning and empirical evidence support the claims we wish to make about candidates based on their test performance?</i>	Construct validity + relevance/utility <i>Are these interpretations meaningful and useful in particular contexts?</i>
Consequential basis <i>(the social context of testing)</i>	Value implications <i>What social and cultural values and assumptions underlie test constructs and hence the sense we make of scores?</i>	Social consequences <i>What happens in our education systems and the larger social context when we use tests?</i>

The top cell of the matrix addresses the technical quality of the test, and focuses on the meaningfulness of claims about individual test candidates based on their test scores. Messick defines two main threats to the meaningfulness of these inferences drawn from scores:

2 VALUES IN LANGUAGE ASSESSMENT

construct underrepresentation and *construct-irrelevant variance*. The former refers to situations where the testing procedure does not do justice to the nature of the knowledge and skills targeted in the assessment—for example, a writing test that focuses only on grammar and vocabulary, and ignores other aspects of writing, or a speaking test that does not involve interaction with another speaker, as in computer-delivered tests of speaking. The latter refers to the situation where the score is influenced by factors external to the candidate, such as differences in severity or consistency among judges who are scoring writing or speaking assessments. Most research on language testing involves investigating such sources of weakness in the meaningfulness of score inferences, and elaborate and sophisticated technical means for exploring these issues have been developed.

The social context of testing is set out in the two lower cells of the matrix. Messick distinguishes between the *values*, which are embodied in test constructs, and the *consequences* of the actual implementation of tests. Research and discussion in language testing has increasingly focused on the latter; it has struggled to engage with the former. Exploration of the social context of language testing has been carried out in three main areas: discussion of the ethics of language testing (Davies, 1997, 2004); studies of test washback and impact (Cheng, Watanabe, & Curtis, 2004); and critical language testing (Shohamy, 2001, 2006).

Critical language testing is particularly relevant to the issue of values in language tests, as it focuses on exposing the ideologies embodied implicitly or explicitly in test use. Two test uses that have been better understood through critical investigation are the use of language tests in support of educational and employment policies whose aim is to foster the growth of globalization; and the use of language tests within migration and citizenship procedures.

On the first of these, the clearest example is the program of assessment of the reading skills of 15-year-olds sponsored by the Organization of Economic Cooperation and Development (OECD), an organization based in Paris currently with 33 member states, whose goal is “to help governments and society reap the full benefits of globalisation, while tackling the economic, social and governance challenges that can accompany it” (OECD, 2008, p. 10). The reading assessment is one component of the Programme for International Student Assessment (PISA) (the others are assessments of mathematics and scientific literacy). What is distinctive about the PISA literacy assessment is that it is not specific to the school curriculum of individual participating countries, as assessment of school-based achievement normally is. Instead, the same test is used in every country, to allow comparability of results, the test construct being defined as “important knowledge and skills needed in adult life” (OECD Programme for International Student Assessment, 2009) as understood within the ideology of the OECD. In order for the texts which students read within this single, universal test to work within the diverse national contexts in which the test is taken, they cannot be culturally specific; instead they tend to have a transnational, functional orientation. The impact of the test has been profound since it was first administered in 2000; for example, the results so shook up the German educational system that the term “PISA shock” was coined (Germany had not performed according to the expectations or image of its educational system). Research is now beginning to document and compare the impact of PISA in different national settings including Austria, the Spanish Basque Country, Belgium, Germany, and Israel (McNamara, 2010, 2011).

The second example is another domain of test use arising from globalization and specifically the movement of peoples with the resultant greater social and cultural diversity of industrial societies. Such movement has led to deep social anxiety about changes to the traditional cultural character of societies and a sense of threat, particularly in Europe. As a result, debates about the cultural character of society, and a desire to police the identity of newcomers, have led to the introduction of tests of language at all stages of the process of immigration and settlement in several countries, a policy which is spreading rapidly in

Europe and beyond. While such tests are often framed as being in the best interests of immigrants, in that competence in the national language will facilitate access to the resources and services of the new society for the individuals concerned, it is clear on closer examination of the debates accompanying their introduction (Blackledge, 2009; McNamara & Ryan, 2011) that they are directed at the mainstream politics of the society involved, and involve an attempt to articulate the social values which define the acceptable identity of a citizen in a particular society. A key assumption here will be that to be "Australian," "British," "Dutch," and so on will involve knowing the principal language of the community. Thus the use of tests of language in citizenship contexts is really an expression of social values. The test use has subsequently been extended to earlier stages of the process leading toward citizenship, so that now language tests are being used increasingly as a condition of granting permanent residency, or even entry to the country in the first place, in the case of foreign marriage partners of citizens who in the Netherlands and the UK are required to sit tests of Dutch or English respectively in their home countries before a visa can be issued (De Jong, Lennig, Kerkhoff, & Poelmans, 2009; Blackledge, 2009). Considerable research effort is currently going into documenting current developments, and to investigating the ideological meaning of the language testing procedures involved (Shohamy & McNamara, 2009; Hogan-Brun, Mar-Molinero, & Stevenson, 2009; Extra, Spotti, & Van Avermaet, 2009).

Language tests play a prominent role in another arena—employment—and here questions of values arise too. English is the language of international aviation, and in recent years the International Civil Aviation Organization (ICAO) has developed policies requiring non-native speakers of English working as pilots or air traffic controllers to pass tests of English language proficiency in order to remain in employment; in future all such employees will need to establish proficiency in English before certification is granted permitting them to practice in these professions. This policy raises the question of the use of English as a *lingua franca* in internationalized workplaces, and the responsibility for successful communication in such settings, particularly those such as aviation, where serious safety issues are in question. The ICAO policy rests on the assumption that responsibility for successful communication in such settings rests on the non-native speaker, who is required to reach a competence where their native-speaking colleagues will be able to communicate with them with relative ease. Recent research on communication in such settings has complicated this simple picture (Kim & Elder, 2009). While agreeing that some minimum level of English language proficiency is required for a person to be able to work safely in these contexts, the researchers have shown that professional competence is as or more important than language proficiency; and, most relevantly here, that the responsibility for successful communication is joint. Native speakers can jeopardize successful communication with non-native speakers by their refusal to adhere to conventions of routine communication involving the use of formulaic language required by ICAO and other agencies, and their incapacity to successfully negotiate meaning with their non-native-speaking interlocutors. What is at stake here is the "ownership of English." Native speakers of English dominate the policy-making committees of ICAO, and the professional English language standards as currently formulated (which make little concession to the fact that English as a *lingua franca* communication is involved) reflect the assumed privilege of the native speaker at the expense of non-native speakers. The construct underlying the test, in other words, is an expression of an assumed social value, native speaker privilege, which is increasingly under challenge in the broader research on English as a *lingua franca* communication (Seidlhofer, Breiteneder, & Pitzl, 2006; Jenkins, 2007; Canagarajah, 2007). This means that current proposals by agencies such as the International Language Testing Association (ILTA) to guarantee the quality of international tests used in the implementation of the ICAO policy are perhaps misguided, as they will perpetuate a testing regime which is enforcing the interests of one group (English native speakers in the international

aviation workplace) at the expense of their non-native English-speaking colleagues. Here is a clear case where the formidable technical competence which an organization like ILTA can make available only serves to distract attention from the value-laden questions of justice underlying the policy the tests are intended to serve.

The need to bring issues of values in testing to the fore, given that they usually remain implicit or are indeed obscured, has led to a proposal to distinguish *fairness* from *justice* in language testing (McNamara & Ryan, 2011), in the following terms: while *fairness* assumes that a testing procedure exists, and questions the meaningfulness of the results it yields in relation to its construct, *justice* questions the use of the test in the first place, not only in terms of its effects and consequences, but in terms of the social values it embodies. Simply speaking, then, fairness refers to the top two cells (the top line) of Messick's validity matrix above while justice refers to the bottom two cells. This means that tests may be *fair* (technically capable of making distinctions among individuals) but *unjust* (implementing an indefensible policy, as has been argued here about the ICAO proficiency requirements); or *just* (implementing a policy designed to protect patients in clinical contexts by requiring for example immigrant health practitioners to be able to demonstrate clinical communicative competence in the language of the clinic) but not *fair* (because the test lacks reliability or relevance to the workplace). Determining the fairness of tests has a long tradition of research, and is supported by the use of well-established technical procedures; determining the justice of tests takes us into much more uncertain waters, and will inevitably involve controversy. But the challenge of the justice of tests is arguably the most important issue currently facing the language testing field. There is a need for a changed education of language testing researchers, as the current strong cognitive and psychometric orientation may, in the worse case, act as a handicap in rising to this challenge.

Values in Language Teaching

TARA ZAHLER

Formal research and scholarship in applied linguistics directly focused on values in language teaching only began to surface at the turn of the 21st century. Yet, values underlie nearly every dimension of the field. In much of the scholarship, the word “values” and the word “morality” are used interchangeably. Buzzelli and Johnston (2002), in their work on the moral aspects of teaching as it relates to language, power, and culture, define morality as a set of beliefs that are “evaluative” (p. 3). In other words, they are beliefs that inform decisions about what is right and wrong. Buzzelli and Johnston explain that it is precisely at the intersection between the individual and the social where important questions about morality and values come into play. Researchers who work in this area have focused on both the macro and micro dimensions of values in language teaching. The micro dimension focuses on values in classroom teaching while the macro investigates how language teaching is situated in the broader educational and societal context. In both cases, scholarship about values in language teaching centers on making explicit the underlying values individuals or groups bring to teaching and learning that often remain hidden until examined.

Historical Foundations From General Education

Inspiration for current scholarship about values in language teaching began in general education. John Dewey’s (1909) writings serve a foundational role for scholars interested in the moral nature of schools through the shaping of the individual to participate in social life in a democratic society. Nel Noddings (1984, 1992) has also been an influential figure for those interested in values in teaching. Her work in educational philosophy focuses on the teacher–student relation as one grounded in caring and responsiveness. Alan Tom’s (1984) work replaces a traditional view of teaching as an applied science composed of a set of technical skills to be learned with the metaphor of teaching as a moral craft involving a reflective and skilled practitioner. A few years later, Jackson, Boostrom, and Hansen (1993) carried out a long-term ethnographic study where they identify not just overt moral instruction in schools, but also practices in classrooms that manifest the moral indirectly and oftentimes invisibly. Hansen (2001) goes on to argue that teaching itself is a moral activity. The moral is inescapably engrained in the very practice of teaching rather than existing as an invasion from some outside source or philosophy.

Contemporary Scholarship on Values in Language Teaching

The formal discussion on values officially entered the realm of language teaching when Julian Edge (1996) addressed the field of TESOL in an article expressing common central values that inform action in the field as well as the related paradoxes that surface because teachers are not automatons, but individuals guided by deeply held personal values. Edge explains that paradoxes of clashing values appear in the field when there are inconsistencies between the personal, the professional, the political, and the cultural. One example of such a paradox is when sociopolitical context informs classroom methods in such a way that teachers are thought to be passive technicians who deliver a predetermined, standardized

DOI: 10.1002/9781405198431.wbeal1246

product to homogeneous students. In reality, appropriate teaching and learning decisions are extremely context specific and require individual decision making. Another paradox lies in what Edge calls the “threat of certainty” (p. 21), which describes when people believe so strongly in their own view that they feel they have the right to impose it on others, even to the point of cruelty or violence. The paradox for Edge is how to exclude this extreme absolutism from being condoned despite the argument that respect for differences must be a core value in the field.

A second inaugural article addressing values in language teaching is a study by Johnston, Juhász, Marken, and Ruiz (1998) investigating the moral dimensions of teaching adult ESL students in a university setting. With the framework established by Jackson et al. (1993) as a foundation, Johnston et al. (1998) use classroom discourse and real examples to demonstrate how seemingly innocuous class workings such as attendance rules and teacher expectations for student participation are deeply moral and highly complex. Johnston et al. reason that this is even more profound due to the multilingual and multicultural classroom context. A follow-up study by Johnston, Ruiz, and Juhász (2002) examines students’ own perceptions of key moral incidents in their English language class based on extensive interviews.

With two books and a number of articles published in the area, Bill Johnston has accomplished the most comprehensive and most current work related to values in language teaching. Johnston (2003) holds that language teaching is a “profoundly value-laden activity” (p. 1). He considers teaching a moral activity for three primary reasons. First, Johnston places the teacher–student relation (from Noddings, 1984) at the core of teaching. Since this relation involves human interaction, and because there are power dimensions involved, Johnston insists on the presence of the moral. Second, teaching is value-laden because its goal is to change people for the better. Finally, Johnston explains that many of the decisions teachers must make in the classroom and outside the classroom are not scientifically proven truths with clear, objective answers that can be applied in every situation. Rather, teachers must make personal decisions about how best to handle nearly every aspect of teaching based on their own beliefs and context.

One of the major points that Johnston (2003) makes is that the decisions language teachers must make about teaching can often be thought of as moral dilemmas. This is because of their complex, subjective, contextual, and personal nature. Johnston discusses examples of moral dilemmas real teachers face in three important areas: pedagogy, teacher–student relations, and beliefs and values (p. 145). Pedagogical dilemmas involve such questions as how to balance content and form, and how to evaluate students fairly. Relational questions ask how to use teacher authority, and how to negotiate personal beliefs with institutional requirements. Finally, moral dilemmas related to beliefs and values bring to light such questions as how (English) language learning is wrapped up in the politics of opportunity or hegemony, how religious beliefs should or should not inform one’s decisions about teaching (Varghese & Johnston, 2007), and how one balances tolerance and intolerance.

Throughout his discussion of real moral dilemmas in language teaching contexts all over the world, Johnston explains that these questions are especially complex due to the layers of competing values involved. Above all, Johnston encourages teachers to examine the values that inform their teaching as well as reflect on the dilemmas that they face. He insists that because it is impossible to escape questions of morality and values in teaching, it is a teacher’s responsibility to analyze her/his own work.

A second book published about the same time as Johnston’s (2003) also addresses dilemmas in language teaching. Through the lens of social justice, Hafernik, Messerschmitt, and Vandrick (2002) focus on the complex ethical issues found in post-secondary English-language-teaching contexts. Plagiarism, evaluation, academic freedom, and counseling students are examples of some of the issues that these scholars investigate. In another

university setting, Kim Johnson's (2003) work in a language-teaching practicum investigates three critical incidents between a mentor teacher and a practicum student teacher. Values related to non-native speaker proficiency, cultural preferences, and religious beliefs are discussed. Johnson acknowledges how teachers' personal values and assumptions enter the realm of the social classroom. In a rare example of values-related scholarship focusing on a language other than English, Angela Scarino (2005) reports on foreign-language writing assessment practices used by three secondary teachers of French in Australia. Scarino finds that teachers position themselves dually while assessing students. An intellectual positioning focuses on academic performance while a social and ethical positioning is directed at the human dimension of how best to support students' learning.

Focused on more macro level issues, Graham Crookes (2009) discusses values in his work on "radical" teaching, a term he uses to encompass various types of teaching that are actively opposed to the oppressive social forces in mainstream education that reproduce the status quo. Crookes explains that critical and feminist pedagogies are both radical in that they are concerned with curricular decisions aligned with political aims such as those that support anti-imperialist, antiracist, and antipatriarchal values.

Though the area of values in language teaching is not one that is widely discussed and researched, especially in languages other than English, it does underlie all aspects of teaching and learning at both micro classroom levels and macro political levels. The overarching message by scholars in this area is that teaching is not a value-neutral activity. Therefore, because teaching decisions are essentially value-laden, teachers are encouraged to thoughtfully reflect on both the transparent and the more subtle moral dilemmas they face, as well as the values they promote in their personal teaching contexts.

van Dijk, Teun A.

ALEXANDRA JOHNSTON

Introduction

Teun A. van Dijk (1943–) is one of the leaders and shapers of the critical approach to discourse analysis, most commonly referred to as critical discourse analysis (CDA). He is most widely known for his sociocognitive approach to critical research on racism, ideology, knowledge, context, and cognitive approaches to discourse processing. His research has been published in over 30 books and edited volumes as well as over 250 scholarly articles. He was professor of discourse studies at the University of Amsterdam until 2004, and since 1999 has been a visiting professor at the Universitat Pompeu Fabra in Barcelona. He has founded six international journals, and still edits four of them. Many of his books, articles and project summaries can be found on his Web site: www.discourses.org

Academic Background

Born in Naaldwijk, the Netherlands, Teun van Dijk began his academic career in the 1960s studying French language and literature at the Free University of Amsterdam and in Strasbourg, France. His next degree in literary theory came from the University of Amsterdam, which was to be his institutional base for over 30 years. His first publications extended Chomskyan transformational-generative grammar (a set of rules that “generate” or structurally describe grammatically well-formed sentences) to formally describe the structure of literary texts. In addition to describing coherence relations among sentences, van Dijk turned his attention to the coherence of texts as a whole. He referred to the overarching structure of a text (its format or schema) as the superstructure, and to the global meaning of a discourse as its macrostructure. His attention to global coherence and how texts are mentally processed—then not a popular or fertile area of study in linguistics—led to his interdisciplinary work with psychologists.

Van Dijk’s interest in the cognitive processing of discourse and in forging connections between his work and that of others outside his discipline informed his research for years to come. His interdisciplinary collaborations with the American psychologist Walter Kintsch produced several articles and the book *Strategies of Discourse Comprehension* (van Dijk & Kintsch, 1983), which laid the foundation for a cognitive theory of text processing and how people strategically understand texts. This theory attempted to model the mental processing of language users as they engage in online, moment-by-moment text production and comprehension. This model drew upon research into short- and long-term memory storage, the “scripts” (Schank and Abelson, 1977) upon which users rely to organize their knowledge about recurrent situations, and the idea that language users refer to mental models to interpret texts and make them intersubjectively coherent.

In the 1980s, following a teaching sojourn in Mexico City and travel to other parts of Latin America, van Dijk’s work took a critical turn as he began to analyze sociopolitical issues, such as racism. As he wrote in his academic autobiography, “I finally decided it was time to do something serious” (van Dijk, 2004, p. 14). For the next thirty years, he

studied how racism is expressed, reproduced, and legitimated in text and talk by social elites. He embarked upon several long-term projects that described how White majorities think, talk, and write about ethnic minorities, immigrants, and refugees.

Two books detailing how White North Americans and Dutch talk about non-White minorities in conversation (van Dijk, 1984, 1987) showed that the conversational topics of talk featuring minorities were largely limited to issues of cultural differences, deviance, and threat. In attempts to preserve a positive self-presentation (as “nonracist”), Whites would make use of semantic moves such as apparent denial (“I have nothing against Blacks, but . . .”) and apparent concession (“not all Blacks are criminal, but . . .”) (van Dijk, 2004, p. 15).

Van Dijk then widened his exploration to describe how racism is expressed and legitimated by societal elites, defined as those who have greater access to shaping and spreading discourse, such as journalists, politicians, and teachers. He undertook several long-term, comparative studies of racism in the press (van Dijk, 1991), academic textbooks (van Dijk, 1987), parliamentary debates (Wodak & van Dijk, 2000), and corporate discourse (van Dijk 1993). Following two books (1988a, 1988b) in which van Dijk led a comparative study of the discourse structure of news articles from several countries, he narrowed the focus of his analysis of the media in *Racism and the Press* (1991), a study of thousands of news reports in the British and Dutch press that demonstrated how racism is reflected and reproduced in the news. The results showed that many of the features of everyday conversations about non-White minorities are mirrored in the press, including a limited selection of topics that tended toward the stereotypical or negative such as difference, deviance, and threat. In addition, news articles often did not follow journalistic guidelines of “balance” in terms of quotation patterns. Articles about minority events or issues tended to quote White majority institutional representatives more often than minority voices. Quotes by minorities about topics such as racism or discrimination were often framed by quotation marks, as in “‘racism’” or “‘alleged’ racism,” as a way to undercut the authority of their assertions.

Major Contributions

Teun van Dijk has contributed to the study of text and talk through several long-term research projects. These longitudinal, interdisciplinary studies include foundational work in CDA, racism, knowledge, ideology, and context.

CDA, as van Dijk states (2001), is not a methodology, a field, or a school. It describes the perspective of the researcher as well as a “movement” of researchers from different fields who use a variety of methods, theories, and assumptions in engaging in research on social injustice. It is in part a reaction to previous research paradigms that claimed to be “neutral,” “asocial,” or value-free. CDA recognizes that researchers are never uninfluenced by the societies in which they work, and argues for analyzing how researchers are influenced by ongoing social and political processes. Also inherent in the critical approach to discourse analysis is examining the relationship between discourse and society with a specific interest in how power is reproduced in discourse and in shedding light on abuses of power. CDA holds that there are fundamental power inequities in society that are perpetuated by elites, such as journalists, lawmakers, academics, and others with access to shaping public discourse. CDA focuses on power, domination, and social inequality, and on the relevance of gender, race, and class in the study of text and talk (van Dijk, 2001).

In addition to his published research in CDA, van Dijk has played a role in bringing together scholars with an interest in CDA. In 1991, he organized a meeting in Amsterdam of critical scholars from several countries (mostly in Europe) that came to be regarded

as the “formal and institutionalised” beginning of CDA (Kendall, 2007, p. 3). This group then began to meet annually and remain connected through an online network started by van Dijk called CRITICS (Centers for Research Into Texts, Information and Communication in Society). Regular participants in these meetings included Norman Fairclough (University of Lancaster), Gunther Kress (University of London), Luisa Martín Rojo (Madrid), Ron Scollon (Georgetown University, Washington, DC), Teun van Dijk (Amsterdam and Barcelona), Theo van Leeuwen (London, Cardiff, and Sydney), and Ruth Wodak (Vienna and Lancaster) (van Dijk, 2004, p. 26).

In recent years, van Dijk and others have come to prefer the broader term “critical discourse studies” (CDS), in order to emphasize the institutional similarity to other interdisciplinary fields such as women’s studies, cultural studies, gender studies, and others. To be more precise (and consistent with the idea that scholars engaged in CDA are part of a movement), van Dijk considers “discourse studies” an interdisciplinary field that ranges across the humanities and social sciences, within which CDA/CDS is a movement of critical scholars.

In addition to organizing meetings and networks, van Dijk founded the international journal *Discourse & Society* in 1990 as a forum for critical work in discourse analysis that focuses on social and political issues. This journal became at one time the most cited journal in communication (van Dijk, 2004, p. 27). In total, van Dijk has founded six international journals, including *POETICS* (1971–9), *TEXT* (1981–97; now *TEXT & TALK*), *Discourse & Society* (1990–), *Discourse Studies* (1999–), *Discourse and Communication* (2007–), and the Internet journal in Spanish *Discurso & Sociedad* (2005–), and still edits the latter four. His work as an editor as well as an organizer of scholars has helped to bring together communities of scholars in virtual and face-to-face networks, as well as to foster interdisciplinary collaborations.

Van Dijk has also contributed to CDA through his writing on ideology, knowledge, and discourse. His work on ideology (van Dijk, 1999) combines earlier ideas from the cognitive study of discourse (such as his work with Walter Kintsch) with later ideas on social cognition, power, racism, and the reproduction of power through discourse. In van Dijk’s view, individual beliefs (that may be racist or sexist) are based on socially shared beliefs, such as the attitudes and ideologies of groups and the knowledge of a whole community. Individual ideological beliefs then influence discourse and other social practices. By linking ideology with discourse, van Dijk attempts to bridge the “micro–macro gap” between the individual and society. As he asserts:

Ideologies control social representations of groups, and thus the social practices and discourses of their members. This happens through the ideological control of mental models which in turn . . . control[s] the meaning and the functions of discourses, interaction and communication. And conversely, ideologies may be “learned” (and taught) through the generalization of mental models, that is, the personal experiences of social members. (van Dijk, 2004, p. 28)

Van Dijk recently returned his attention to the theoretical definition of context that expanded his earlier consideration of the topic in his 1977 book *Text and Context*. His two books *Discourse and Context* (2008) and *Society and Discourse* (2009) provide a sociocognitive, multidisciplinary theory of context. Asserting that the use of the word “context” in the social sciences has too often been a “fuzzy notion denoting a situational, historical, geographical, social, or cultural environment of a phenomenon being studied” (van Dijk, 2007, p. 285), he provides “a sociocognitive approach to context that combines interactional, discursive and cognitive analysis” (p. 312). Context is therefore defined as a subjective participant construct, not objective social conditions or constraints. “It is not the social

situation that influences (or is influenced by) discourse, but the way the participants *define* such a situation" (van Dijk, 2008, p. ix). Using the extended example of a parliamentary debate from the British House of Commons, van Dijk describes the types of mental models participants draw upon in creating and interpreting ongoing interaction.

After over 30 years at the University of Amsterdam, van Dijk emigrated to Spain in 1999 to teach and research at Universitat Pompeu Fabra in Barcelona. This move led to his pursuing the study of racism with a particular focus on Spain and Latin America. He wrote a book (van Dijk, 2003) on the topic (one of the many books in Spanish that he has published), and led an international project in Latin America with teams in seven countries to study discursive racism. Fluent in Spanish (as well as Portuguese, French, German, Dutch, and English), van Dijk has lectured widely throughout Latin America, held visiting professorships at the University of Campinas, Brazil, and the University of Valparaíso, Chile, and received honorary doctorates from the University of Buenos Aires and the National University of Tucumán, Argentina. Van Dijk has used his role as an editor, teacher, and researcher to cross language and disciplinary boundaries in order to strengthen a community of scholars with an interest in understanding text and talk and rectifying social injustice.

van Leeuwen, Theo

EMILIA DJONOV

Overview

Theo van Leeuwen (1947–) is a cofounder, alongside Gunther Kress, of multimodality as a discipline within applied linguistics, education, and media and cultural studies. He is also a central figure in critical discourse analysis (CDA). Multimodality and CDA form intertwining streams in his research, which has made groundbreaking, rich, and influential contributions to semiotics and discourse analysis. Together they inform his model of social semiotics as a form of enquiry that crosses disciplinary boundaries in order to reveal how people make meaning using a variety of semiotic resources and technologies in and across changing social contexts. This model evidences what is at the heart of all of van Leeuwen's work—a strong connection between semiotic theory and semiotic practice.

Outline of Research Life, Influences, and Contributions

Van Leeuwen's interest in semiotics originated during his studies at the Dutch National Film Academy in Amsterdam. After working and teaching in the areas of film and television production in Australia for several years, he studied film semiotics under Christian Metz in 1980 at the Centre for Interdisciplinary Studies in Semiotics, Anthropology and Sociology in Paris. Van Leeuwen's first academic research was his MA honors thesis, *Professional Speech: Accentual and Junctural Style in Radio Announcing* (1982). It extended knowledge in linguistics and media studies by demonstrating that the intonation of radio announcers is governed by a professional code developed to uphold particular sociocultural values toward the content (e.g., immediacy and impartiality in newsreading, or companionship in easy listening programs) and relations between radio announcers, the institutions they represent, and their audiences. A sociolinguistic orientation characterizes his doctoral research (van Leeuwen, 1993), too, which offered a model for revealing how texts transform the social practices they represent in order to support various ideologies. This model was developed through analyses of texts about the first day at school, using Halliday's (1978) theory of language as a social semiotic (i.e., as a resource for making meaning) and systemic functional linguistics (SFL), which, alongside the work of Rudolf Arnheim, Roland Barthes, Basil Bernstein, Roman Jakobson, and R. Murray Shafer, has remained a key inspiration behind van Leeuwen's later research.

Another defining influence on van Leeuwen's work is his long-lasting collaboration with Gunther Kress. Inspired by Hodge and Kress's (1988) *Social Semiotics*, they presented the first systematic extension of social semiotic principles to a mode other than language in their seminal book *Reading Images* (1990, 2006 [1st ed., 1996]) and the first outline for a theory of multimodal communication in *Multimodal Discourse: The Modes and Media of Contemporary Communication* (Kress & van Leeuwen, 2001).

Van Leeuwen has continued actively contributing to and supporting advances in multimodality and CDA, by conducting independent and leading collaborative research projects as well as through his role as the founding coeditor (with Carey Jewitt) of the

journal *Visual Communication* and his teaching in communication studies, in the UK as a professor at the London College of Printing (1993–9) and Cardiff University (1999–2005), and in Australia, first as a lecturer at Macquarie University (1981–93) and since 2005 as Dean of the Faculty of Arts and Social Sciences at the University of Technology, Sydney.

Key Ideas

Van Leeuwen (2005a, p. 3) proposes that to understand meaning making social semioticians

1. collect, document, and systematically catalogue semiotic resources—including their history;
2. investigate how these resources are used in specific historical, cultural, and institutional contexts, and how people talk about them in these contexts—plan them, teach them, justify them, critique them, and so forth;
3. contribute to the discovery and development of new semiotic resources and new uses of existing semiotic resources.

By pursuing these goals van Leeuwen's social semiotic research on multimodality and CDA has advanced semiotic theory as well as practice.

Multimodality

Van Leeuwen's work has been instrumental in establishing and contributing to the two main strands of research on multimodality that have emerged to date: (a) mapping the meaning potential of separate semiotics resources, and (b) theorizing and analyzing the interaction of these resources in multimodal communication.

The first strand is pioneered by Kress and van Leeuwen's (2006) *Reading Images: The Grammar of Visual Design*, which presents analyses of a rich variety of visual texts (advertising and news images, maps and technical diagrams, pages from magazines, picture books, and textbooks, and Web pages). While incorporating insights from structural semiotics, Gestalt psychology, iconography, film, and fine arts, it is based on two key tenets of systemic functional theory: (a) every act of communication simultaneously realizes three broad types of meaning: ideational (representing patterns of experience and the logical relations between them), interpersonal (enacting social relations and values), and compositional/textual (interweaving ideational and interpersonal meanings into cohesive and coherent exchanges of meaning, i.e., texts); and (b) the meaning potential of semiotic resources can be modeled paradigmatically and presented as systems of available choices for realizing these three types of meaning, or metafunctions. Kress and van Leeuwen (2006, p. 20) consider SFL "a good source for thinking about all modes of representation" (p. 20), yet seek to avoid imposing categories for describing language on other modes. This distinguishes their approach from other systemic functional frameworks for analyzing visual and multimodal texts.

Another major contribution to this research strand is van Leeuwen's (1999) unified theory of sound semiotics, which reflects his background in film production (where a soundtrack is viewed as a platform for the interaction of speech, music, and other sounds), experience as a jazz musician, and earlier research on intonation. Van Leeuwen models the meaning potential of sound starting from material qualities (e.g., timing, timbre) and then relating these to meaning before concluding that sound is better equipped for realizing interpersonal and textual rather than ideational meanings. This "bottom-up" direction is motivated by his view that sound is not yet a fully fledged mode like language

and visual design, which due to their more widespread and regulated use can be taught, debated, and modeled in more abstract ways. In the case of sound, “meaning is constructed quite differently, on the basis either of an *experiential meaning potential*, hence grounded . . . in our bodily experience of [its] materiality, and/or *provenance*, hence grounded in intertextuality” (p. 192).

Provenance and experiential meaning potential are also key to van Leeuwen’s mapping of other material resources that have traditionally received marginal attention in semiotics and linguistics, including kinetic design (van Leeuwen & Caldas-Coulthard, 2004), color (van Leeuwen, 2011a), typography (van Leeuwen, 2006), voice quality (van Leeuwen, 2009), and texture (Djonov & van Leeuwen, 2011). For example, the provenance of cashmere—that is, knowing that it originates in the mountainous region of Kashmir and is a labor-intensive product first imported in 19th-century Europe by British colonialists—allows its texture to be seen as exotic, pristine, expensive, or as a symbol of colonial exploitation, or all of these, whereas bodily experience of its softness evokes associations with comfort, warmth, and elegance.

To model the experiential meaning potential of material resources van Leeuwen (2009) employs what he calls “parametric systems.” A parametric system presents those physical qualities, or affordances, of a given resource which people have taken up in communication. These qualities are always gradable and together define the meaning potential of a given signifier such as a texture or a color. An object’s color, for instance, can be described as a combination of degrees of each of ten parameters: value, saturation, purity, transparency, luminosity, luminescence, luster, temperature, modulation, and differentiation (van Leeuwen, 2011a, pp. 55–69). Parametric systems are inspired by Jakobson and Halle’s (1956) distinctive features theory, according to which a phoneme can be defined in terms of the presence or absence of each of a small number of distinctive features so that one phoneme can be differentiated from another (e.g., the alveolar fricative consonants /s/ and /z/ are distinguished from each other through respectively the absence and presence of voice as a distinctive feature). Van Leeuwen’s parameters, however, differ from distinctive features in that they are gradable (rather than binary choices) and not only allow one signifier to be differentiated from another but add layers of meaning to it. By articulating the meaning potential of marginalized semiotic resources, van Leeuwen enables it to be explicitly taught and more fully exploited, thereby expanding semiotic theory as well as practice. By highlighting the role that people’s use of material resources (or media) in communication plays in the formation of modes, his work also problematizes the distinction between mode and media, which is a considerable challenge for multimodality research (see Bateman, 2011).

Echoing issues raised in van Leeuwen’s earlier work, Kress and van Leeuwen’s (2001) map for a theory of multimodality offers two significant proposals for the second strand of multimodality research. The first is that there are meaning-making principles which can be realized by different modes in ways reflecting each mode’s unique characteristics, and that these principles can be used to develop tools for analyzing multimodal communication. Van Leeuwen has established several such principles—genre, style, framing, salience, rhythm, modality, and conjunctive, or logico-semantic, relations—and demonstrated their value for analyzing relations within and between modes in a wide variety of texts (e.g., magazines, textbooks, three-dimensional objects, film, architectural space, soundtracks, and hypermedia) (see van Leeuwen, 1985, 1991a, 2003, 2005a, 2005b, 2011b) and for creating meaning in new media design (Martinec & van Leeuwen, 2009).

Kress and van Leeuwen’s (2001) second proposal is that multimodal communication is organized into four strata, which all bear meaning:

1. Discourse, “socially constructed knowledge(s) of (some aspects of) reality” (p. 4);
2. Design, the realization of discourses through various semiotic resources;
3. Production, the material articulation of a semiotic event or artifact;
4. Distribution, “the technical ‘re-coding’ of semiotic products and events, for purposes of recording . . . and/or distribution” (p. 21).

As they are concerned with expression, the concepts of production and distribution highlight the contribution of materiality and technologies for producing/recording and distributing multimodal texts to the meaning of specific semiotic practices as well as over time to changes in these practices and the formation of new modes and social relations. Complementing his studies of technologies for sound design, production and distribution, and material semiotic resources, van Leeuwen’s current research explores the interaction between the design and use of ubiquitous semiotic software, or software designed for making meaning, such as Microsoft’s Office suite. This research shows, for example, that semiotic software contributes to changes in both speech and writing (see van Leeuwen, 2008b) and increases the dominance of visual over tactile resources (Djonov & van Leeuwen, 2011).

Critical Discourse Analysis

Van Leeuwen’s major contribution to CDA is the theoretical and analytical framework presented in *Discourse and Practice: New Tools for Critical Discourse Analysis* (van Leeuwen, 2008a). Informed by perspectives from anthropology, sociology, and philosophy, its underlying idea is that there is a distinction between social practices and their representation in texts, or discourses. Van Leeuwen further argues that “all discourses recontextualize social practices” (2008a, p. vii), which is why the same social practice may be subject to different representations, or attract “a plurality of discourses” (p. 6). This argument extends to all discourses Basil Bernstein’s (1990) theory that the recontextualization of knowledge from the contexts in which it is produced to those where it is reproduced and disseminated through pedagogic discourse involves semantic shifts that maintain the existing social order.

Van Leeuwen’s theoretical argument is complemented by a method for relating social practices to discourses about them so as to achieve the defining goal of CDA—to reveal how discourses perpetuate social boundaries, oppression, and inequality. In this method, originating in van Leeuwen’s PhD research, a social practice (i.e., a sequence of physical or semiotic activities, or both) is analyzed into its component elements: social actors, their activities and reactions to these activities or to other elements of the social practice; the location(s) and time(s) of the practice; and grooming, dress, tools, and materials required for it. The next step is to analyze how representations of the social practice transform it through the use of verbal or nonverbal resources, or both, by substituting, deleting, and rearranging its elements or by adding evaluations, purposes, or legitimations, or adding all of these. Van Leeuwen (2008a, pp. 17–18) demonstrates, for instance, how in a text about the first day of school a nominalization transforms the action of a teacher separating children from their parents by representing it as a phenomenon (“the separation from families”), deleting the teacher, who is a central actor in this activity, and substituting individual children and parents (e.g., Mary and her mother) with aggregate nouns (“families”). Van Leeuwen’s linguistic analyses employ SFL, a framework with well-established usefulness in CDA (see Young & Harrison, 2004).

An influential distinguishing feature of van Leeuwen’s CDA framework is the understanding that nonverbal and multimodal representations play a crucial role in (re)establishing dominant ideologies. To expose this role, van Leeuwen (2008a) argues, CDA needs to consider not only what is or is not represented nonverbally or multimodally (e.g., whether

there are images of black people in the media) but also how such representations are constructed, as illustrated in his early analyses of a TV news item and easy listening music (van Leeuwen, 1986, 1991b). Van Leeuwen (2008a), for instance, shows that an oblique horizontal angle can be used to depict a group of people as “other,” creating a symbolic detachment between depicted social actors and viewers, and that the kinetic design of toys, too, can reflect racial and gender stereotypes. Machin and van Leeuwen (2007) see multimodal genres as instruments that women’s magazines and war games employ to impose global formats and associated Western values on local content, while van Leeuwen (2005a) reveals how advertising discourses employ combinations of signifiers such as dress, color, smell, and so on to create and market new social identities, or lifestyles, which mask consumerist values and power relations. These studies forge a new direction in applied linguistics—the critical analysis of multimodal discourse—and demonstrate its value for semiotic and multimodal theory, education, and media and cultural studies.

Van Leeuwen’s model of the relationship between discourse and social practice also advocates a holistic approach to social semiotics in general. This approach involves considering semiotic practices, that is, how people use semiotic resources and technologies in specific sociohistorical contexts, in relation to the ways in which they talk about and justify (aspects of) these practices. Analyzing both semiotic practices and discourses about them has allowed van Leeuwen (2005a, pp. 47–68) to develop an inventory of semiotic rules, or norms that govern people’s use of semiotic resources and technologies. These include rules imposed by people in power (personal authority), by writing (the law, religion, etc.), tradition, and the design of objects (e.g., toys) and technologies (e.g., PowerPoint) used in communication (impersonal authority), and rules developed by observing and conforming to trends, emulating role models, and drawing on the opinion of experts. Awareness of such rules is key to both understanding and contributing to semiotic change.

van Lier, Leo

HEIDI BYRNES

Leo van Lier (1944–) contributes to the field of applied linguistics an encompassing, sustained, and critical scholarly engagement with language teaching and learning as it can be observed close-up in the L2 classroom. Reflecting the perspective of educational linguistics as an interdisciplinary field par excellence, his most expansive treatment of the topic occurs in three major monographs, *The Classroom and the Language Learner: Ethnography and Second-Language Classroom Research* (1988), *Interaction in the Language Curriculum: Awareness, Autonomy and Authenticity* (1996), and *The Ecology and Semiotics of Language Learning: A Sociocultural Perspective* (2004). These studies are flanked by articles in refereed journals, book chapters, handbook entries, published conference papers, and conference presentations around the world. They are extended by his past and ongoing work as a coeditor, general editor of the book series *Educational Linguistics* of Springer Publishers, as editor of the *Modern Language Journal*, and a member of the editorial team preparing textbooks in Quechua. Together, these contributions reveal a scholar who explicitly links insights from diverse fields in the humanities and social sciences (e.g., philosophy, psychology, sociology, anthropology), from the educational literature, and from educational practices and traditions. His scholarly goal is to help develop a well-grounded theory of practice; his praxis-oriented educational goal is to “increase understanding, generate new knowledge and provide guidance on how to improve the settings in which the research (and/or intervention) activity is carried out” (van Lier, 1997a, p. 103). For both goals, he sees theory, research, and practice as “inseparable ingredients in the professional conduct of a language educator” (van Lier, 1996, pp. 2–3). Since practice is “the chief impetus for the development of a theory of practice” (1996, p. 30), he prefers the microview even as macro-theoretical issues are always at issue. Reflecting the central role he assigns to careful observation of classrooms and of his strong preference for nondichotomous thinking, his most salient contribution to the field is an ecological-semiotic perspective on language teaching and learning.

Van Lier’s work is anchored in a sociocultural stance that stands in pronounced opposition to the psycholinguistically oriented cognitive process view dominant in much theorizing and SLA research. Its outstanding construct is that of ecology, which assumes a mind–nature unity and perception–action–language development connections. On that basis, van Lier has questioned influential constructs in SLA research and practice (e.g., *input, output, access to a system, negotiation of meaning, agency, attention*), as well as diverse pedagogical and assessment approaches. In their place he advocates an ecological framework within which teaching is primarily about providing access to and promoting engagement in meaningful social activity. In the process he has positioned applied linguistics within linguistics as a form of inquiry that considers language as “a meaning-making activity that takes place in a complex network of complex systems that are interwoven among themselves as well as with all aspects of physical, social and symbolic worlds” (van Lier, 2004, p. 53).

Born in the Netherlands, van Lier considers himself an educator. After completing the Pedagogische Academie as a fully certified teacher in the Dutch system (1964) and after also completing a Certificate in Teaching English (1964–7), he joined the Longman Group

in various positions in the United Kingdom (1970–3), in Scandinavia (1973–7), and in Latin America (1977–9). In 1980 he was awarded an MA in linguistics for language teaching and in 1983 a PhD in linguistics, both from the University of Lancaster, UK. After a two-year stay in Peru (1982–4), working as a foreign expert on a bilingual education project where he represented the Quechua side, he moved to the United States. There he has held permanent positions at the University of Northern Iowa and the Monterey Institute of International Studies, his current institutional home, and a range of positions as visiting scholar, visiting professor, and research fellow at institutions in the United States, Europe, and Asia.

Through formal training, intellectual habitus, and personal experience, van Lier has developed unusually broad knowledge in a variety of areas, particularly in philosophy, history, literature, and the history of ideas of both European and American provenance, and has repeatedly challenged himself to learning new languages (e.g., Danish, English, Finnish, French, German, Quechua, and Spanish). It is not unreasonable to suspect that this has fostered his ability and willingness to put forward lines of thinking independent of, at times even at odds with, canonical approaches in SLA research and language education. Looking across the spectrum of what has been thought, he seeks to recover traditions of intellectual activity and dynamism that a needlessly narrow interpretation of “scientific” work tends to obscure. Of particular import for his intellectual stance are the philosopher/philologist Bakhtin, the ecological anthropologist Bateson, the educational sociologist Bernstein, the sociologist-philosopher Bourdieu, the developmental psychologist Bronfenbrenner, the educational theorist Dewey, the ecological psychologist Gibson, the theoretical linguists Firth and Halliday, the semiotician-philosopher Peirce, the sociocultural developmental psychologist Rogoff, the social psychologist Vygotsky, and the philosopher of language Wittgenstein.

Beginning with the assumption that all education is in some form language education, van Lier sees as the issue at hand the need to extend the basic insights provided by sociocultural theory with the goal of understanding the language classroom in terms of “language, semiosis, activity, affordance, self and critical action” (van Lier, 2004, p. 20). To him, such an ecological linguistics is “primarily a matter of relationships, rather than objects” (2004, p. 53). Its basic understandings regarding language are: (a) it *emerges* from semiotic activity; (b) it arises “from *affordances* that are brought forth by active engagement, and which enable further action and interaction”; (c) it “arises from indicational processes occurring in *triadic interaction*,” that is, as language users establish joint attention to objects and activities in a particular communicative setting. Importantly, linguistic activity “can be analyzed in terms of *quality*” (van Lier, 2002a, p. 146).

Building on the central construct in sociocultural theory of *mediation* (through tools and artifacts, interaction, and the use of signs), van Lier demonstrates that greater theoretical cohesion can be attained by drawing on insights from a number of related disciplines. First, in semiotics of the Peircean tradition, the sign has been explicated in terms of dynamic signifying processes grounded in iconicity, indexicality, and symbolicity. Applied to the language classroom this theory of the sign means that

the most important key to becoming a member of a community is the indexing or deictic one, the one that allows for pointing, referring, and participating. It allows for the creation and use of relevant affordances and signs . . . and [ultimately] the construction of options for life. (2002a, p. 154)

Second, in order to capture the interdependence between learner and environment van Lier turns to approaches developed in Bateson’s ecological anthropology, which regards *mind* as a social construct, as contrasted with the cognitivist notion prevalent in much

of SLA that locates individual consciousness in the thoughts, feelings, and minds of individual persons. He gains important insights as well from Gibson's study of visual perception with its central notion of *affordance*. Here, he highlights the fact that "language as well as other sources of meaning in the world are not ready-made or ready-given" (2004, p. 90) and that aspects of our environment become relevant to us "as a result of the interaction between perception/activity (through affordance) and agent/environment relationships" (2004, p. 96). A third supportive framework is Bronfenbrenner's notion of nested ecosystems, whereby classrooms can be studied with regard to their actors and artifacts, and patterns of interaction and operation at the four levels of the microsystem, mesosystem, macrosystem, and exosystem (van Lier, 2002b). In this fashion it is possible to understand the classroom as a complex adaptive system.

The constructs of *awareness*, *autonomy*, and *authenticity* offer yet other ways in which van Lier captures the reciprocal and relational quality between individual language users and their world as they make choices, take control, and exert ownership of their world in linguistic interactions. Closely connected to intrinsic forms of motivation, these personal qualities are flanked by interpersonal qualities of achievement, assessment, and accountability that shape language-learning experiences in the classroom. The interrelationship between them van Lier refers to as *contingency* (1996, p. 37), a construct that helps to elucidate the organic interaction between language learning and social interaction.

Van Lier's recent focus on agency is in line with his interpretation of an ecological approach as highlighting action/agency and intentionality. Importantly, "agency is situated in a particular context and . . . is something that learners *do*, rather than something that learners *possess*" (2008a, p. 171). It involves initiative or self-regulation, mediates and is being mediated by the sociocultural context, and includes awareness of the responsibilities one bears for one's actions (pp. 171–2). Agency can then be linked with notions of *voice* and *identity* because "every perception of the target language is simultaneously an act of self-perception" (2008a, p. 177) and every utterance is a way for learners to develop an active role in their linguistic, and that is their semiotic world. It can also be linked with intersubjectivity and *engagement* and *contingency*, inasmuch as every utterance is anchored in the world in four dimensions, backward, forward, and outward in the utterance and inward as a form of self-perception (van Lier, 2009). Van Lier strongly associates agency with the act of perceiving; in reverse, perceiving is a form of action: "affordances are actively picked up by the learner in the pursuit of some meaningful activity" (2008a, p. 176), a way of connecting the known to what is new in another culture and language. Such agency "requires that the learner invest physical, mental, and emotional energy in the language produced" (2008a, p. 178). Behind it lies the claim that "this agency enhances second language development in demonstrable and durable ways" (2008a, p. 178).

Van Lier acknowledges that he does not set out to prove the beneficial consequences of participation and initiative through (preferably longitudinal) learner data, but rather assumes them from the start. That makes his central task one of finding ways of describing what is done in classrooms as compared with what is said. While such a focus may appear to be too indirect and inconclusive for capturing essential qualities of language teaching and learning, much less for putting forth comprehensive theoretical claims, van Lier's approach is consonant with several recent trends in applied linguistics, among them emergentism, chaos and complexity theory, and a dynamic systems approach. Not surprisingly, among his major contributions are several theoretically well-grounded and detailed frameworks for classroom observation and educational activity in general. By respecting the classroom as a social institution he has shown a methodological pathway out of the unsatisfactory simple cause-and-effect relationships that continue to dominate the field. By using a multimodal, multisensory, multiscale, and interventionist approach he can further bolster the argument for the ecological validity of his stance as it yields important

insights for all players—teachers, learners, educational policy makers, and researchers alike.

VanPatten, Bill

JOE BARCROFT

Bill VanPatten's contributions have allowed the field of second language acquisition (SLA) to advance from very basic information-processing models of SLA that lacked details about how learners process second language (L2) input toward finer-grain models that account for why certain parts of input become intake during input processing. The basic tenets of VanPatten's theory of input processing are outlined in *Input Processing and Grammar Instruction: Theory and Research* (VanPatten, 1996). The theory continues to evolve as new psycholinguistic research yields pertinent findings with regard to how learners parse input. His research program is characterized by its inclusion of both linguistic and nonlinguistic approaches, examination of the interface between morphology and syntax, and the innovative manner in which it links SLA theory and research findings to language instruction. In the areas of language teaching methodology and language instruction, VanPatten's publications are world renowned. They include coauthored books with James Lee, such as *Making Communicative Language Teaching Happen* (1995) and *¿Sabías Que...?: Beginning Spanish* (VanPatten, Lee, Ballman, & Dvorak, 1992); his books *Processing Instruction: Theory, Research, and Commentary* (VanPatten, 2004); *From Input to Output: A Teacher's Guide to Second Language Acquisition* (2003); and his innovative telenovela-style instructional video series *Destinos: An Introduction to Spanish* (1992) and *Sol y viento* (2007).

Born in San José, California on February 19, 1955, Bill VanPatten was raised in a Spanish-English bilingual and bicultural environment. His maternal grandparents were political and economic refugees, who had fled from Mexico because of the Mexican Revolution in the early 20th century. As Bill has often noted to friends in informal conversation, early exposure to multilingualism fueled his initial interest in language as a potential area of inquiry, but he would not fully embrace this interest until after substantial exploration of other areas during his early academic career. He earned a double major in political science and Spanish at the University of Santa Clara in 1976 before entering the University of Texas at Austin as a graduate student in Latin American studies. After one semester, he changed his primary field of study to Spanish literature. After realizing that Spanish literature was not the area in which he wished to continue, Bill was making plans to return to California shortly before a pivotal turning point in his life would occur. Professor Carlos A. Solé suggested that Bill try studying linguistics, believing that Bill had the mind for that particular area of study. Heeding his professor's advice, Bill decided to stay for at least one additional semester, took three courses in linguistics, and then he "never looked back" (personal communication, July 2010).

At the University of Texas at Austin, Bill's primary area of training was formal and historical linguistics, with key exceptions, such as a course that he took on child language acquisition with Professor Carlotta Smith. This course sparked Bill's interest in language acquisition. Bill also took courses in psycholinguistics and became interested in the issues of processing and comprehension. He completed his MA in Romance linguistics (1981) with a thesis titled *The Acquisition of Ser and Estar and the Preterit Tense in Two Learners of Spanish* and his PhD in Hispanic linguistics (1983) with a dissertation titled *Processing Strategies in Second Language Acquisition*. The dissertation focused on how first language (L1) processing strategies identified by Bever and Slobin (see Bever, 1970), in particular the first-noun strategy, could be applied in contexts of L2 acquisition.

DOI: 10.1002/9781405198431.wbeal1250

VanPatten's academic career includes positions at Michigan State University (assistant professor, 1983–5); University of Illinois at Urbana-Champaign (assistant professor, 1985–9; associate professor, 1989–95; and professor, 1995–2000); University of Illinois at Chicago (Professor, 2000–6); Texas Tech University (professor, 2007–11); and Michigan State University (professor, 2011–present). His career is marked by the extraordinary impact that he has had on program development and mentorship of students in second language acquisition. To date, he has directed 32 doctoral dissertations for students who continue to advance the field, making him the mentor for at least two generations of highly active SLA researchers.

An essential concept in VanPatten's theory of input processing is that learners (because of their limited processing capacity) allocate processing resources via identifiable processing strategies. One example is learners' tendency to process input for meaning before processing it for form. Another key concept is the *communicative value* of linguistic forms, which is determined by the inherent semantic value of a form (more inherent semantic value increases communicative value) and the extent to which the meaning conveyed by a form is redundant in a given context (less redundancy increases communicative value). As asserted by the theory, learners are more likely to process forms with higher communicative value (e.g., *-ed* for pastness in English when not redundant with other forms indicating the same) than forms of lower communicative value (e.g., *-ed* for pastness in English when temporal phrases such as *yesterday* also indicate pastness).

A prime example of VanPatten's innovative application of SLA theory and research to L2 instruction is his development of a type of focus on form, *processing instruction*, which includes *structured input* as its central feature. Given what research on input processing has revealed about learners' processing strategies, VanPatten proposed that input can be structured in a manner that requires learners, while they are attending to informational content (meaning), to process target grammatical forms more optimally. For example, learners are more likely to attend to the personal *a* in Spanish, which is used to mark direct objects, when they must rely on it to make correct referential inferences while attending to meaning (e.g., *Al elefante lo atacó la gacela. ¿Quién atacó? — El elefante / — La gacela . . . ¿Te parece lógico? □ Sí / □ No:* '[object marker *a*] the elephant (object) it (object) attacked the gazelle (subject)', meaning 'The gazelle attacked the elephant.' Who attacked? — The elephant / — The gazelle.). In processing instruction, students are provided with (a) explicit instruction, (b) strategies instruction (on how to attend to a given target structure more effectively), and (c) structured input activities. Some structured input activities are referential in nature, having one correct response only, and others are affective in nature, having more than one possible response depending on the learner completing the activity.

In addition to his work in input processing and processing instruction, VanPatten was instrumental in the 1980s in moving the field of foreign-language (FL) research closer to SLA research. Prior to that, FL research was concerned with pedagogy and teacher education, and SLA was dominated by data on learners of English. Because of VanPatten's work on the interlanguage of classroom learners of Spanish, he showed that context did not affect the linguistic and psycholinguistic underpinnings of language acquisition. His research encouraged others in the FL context to embrace SLA approaches to classroom FL learners.

Variability in a Dynamic Systems Theory Approach to Second Language Acquisition

MARJOLIJN VERSPOOR AND MARIJN VAN DIJK

Introduction

The role of variability in human development was first pointed out by dynamic systems theorists Thelen and Smith (1994). They argue that development should not be seen as a teleological process—a process that is predetermined and guided by design (p. xv). Instead, they point out that development is an individual, rather erratic discovery process. The learner must discover, try out, and practice each part of the process him- or herself, and this is accompanied with a great deal of trial and error, referred to as “variability.” (Note: we will use the term “variability” to refer to variation in performance within one individual and “variation” to refer to differences among learners.)

In this entry, we will first briefly discuss their findings so it may become clear why it is interesting to look at the everyday messy detail of development, in our case second language development, and why it is interesting to trace different variables over time. Then we will review several studies in both first and second language acquisition to show that variability can provide new insights in language development.

Variability in Motor Skills

Thelen and Smith focus on motor development. They argue that for a child to learn to walk, of course, some preconditions first have to be met before development can take place. The child must have a brain, a spinal cord, and peripheral neuromotor and sensory pathways. For walking specifically, the learner has to have bones, joints, muscles, a cardiovascular system, a respiratory apparatus, skin, and so on, each of which will have its own developmental path, and all of which will interact with one another and with the muscles and neurological pathways needed for walking. If we focus on the process of learning to walk from a bit of a distance, we can see that there are several distinct stages: kicking (first one leg, then both legs), pulling up, moving upright, standing still, finding balance, taking a few wobbly steps, until finally the child can walk. From afar it may seem that each stage follows neatly after the other, but when we look up close we see not only that there are no clear boundaries between each stage but that the transition from each stage is far from smooth and involves lots of variability. Thelen and Smith thus argue that there is not one direct cause for new behavior, but that it emerges from the confluence of different subsystems in muscle development, motor control and intentionality. Within this process, variability in some subsystems will occur because it is necessary to drive the developmental process, allowing the learner to explore and select.

According to dynamic systems theory (DST), variability is especially large during periods of rapid development because at that time the learner explores and tries out new strategies or modes of behavior that are not always successful and may therefore alternate

with old strategies or modes of behavior (Thelen & Smith, 1994). From a more formal perspective, systems have to become “unstable” before they can change (Hosenfeld, Van der Maas, & Van den Boom, 1997). For instance, high intra-individual variability implies that qualitative developmental changes may be taking place (Lee & Karmiloff-Smith, 2002). The cause and effect relationship between variability and development is considered to be reciprocal. On the one hand, variability permits flexible and adaptive behavior and is a prerequisite to development. (Just as in evolution theory, there is no selection of new forms if there is no variation.) On the other hand, free exploration of performance generates variability. Trying out new tasks leads to instability of the system and consequently to an increase in variability. Therefore, the claim is that stability and variability are indispensable aspects of human development.

When we translate the DST insights from early motor development to language development, we may assume the following: A first or second language is a complex system consisting of many subsystems such as the sound system, the grammar system, the lexical system, and so on, all of which are interrelated and may influence each other. Many internal states (cognitive ability, motivation, attitude, emotions, and so on) and external states or events (the general context in which a language is learned, a particular teacher, an illness, and so on) at any given moment may have an effect on the developmental path. All these interrelated factors may cause any part of the learner’s language system to fluctuate from one moment to the next. These fluctuations are rather normal for any (sub)system that has stabilized to any extent. However, strong fluctuations may indicate that a (sub)system is changing. Learning is not linear: in both first and second language development, some subsystems may take off slowly at first, then all of a sudden jump off, and level off at the end. Another subsystem may develop in a completely different way. However, when a (sub)system is moving from one stage to another, we may see a great deal of variability in the learner’s language. Finally, each individual learner has to explore and try out his or her own individual developmental path. Moreover, because learners may have different starting points and learning contexts, there will be variation among learners. In the following sections we will mainly focus on what variability may tell us about L1 and L2 development.

Variability in L1 Development

In the early 1990s, Van Geert (1991) brought DST principles to the domain of early language development. His initial work concerned the application of a logistic growth model to the acquisition of the lexicon (a reinterpretation of data of Dromi, 1986). In later work, he also focused on the role of variability and how different subsystems may interact, for which several methods and techniques were developed.

For example, Van Geert and Van Dijk (2002) focused on the ways variability in individual time-series data of repeated observations within learner’s data can be made more visible by means of a moving min–max graph (see Figure 1), a graph that plots the lowest and highest values over a limited number of data points. For example, in Figure 1, the highest and lowest value of the first 18 data points (1–18) are plotted, and then move to the right one step at the time (2–19, then 3–20, then 4–21, and so on). The point of such a graph is to make the bandwidth of variability visible and thereby help in determining if there is a clear transitional phase or not. In their study in L1, the authors found that the increase in the mean length of utterances was rather gradual, but the use of prepositions showed the kind of variability Thelen and Smith (1994) had mentioned, one that showed a clear transitional phase, with a wide bandwidth in the degree of variability.

A further study by Van Dijk and Van Geert (2011) showed that also the qualitative use of prepositions can be interpreted in terms of different, albeit overlapping, stages. Initially

Figure 1 Moving min-max graph of development of spatial prepositions (time window of 18 days, last window 15 days). © Van Geert and Van Dijk (2002), p. 356

the children used prepositions quite incorrectly (compared to adult use of these forms), then there was a decrease in errors accompanied by the increased use of target forms, and finally, there was a stage where target forms were interspersed with nontarget forms. The learners also showed clear individual differences: In one child there was a fairly gradual emergence of the target grammatical strategy without statistically significant peaks, while for another there was a much more abrupt bulb in the pattern of variability and a statistically significant peak in the use of the target form.

Along similar lines, Behrens (2002) traced the acquisition of the highly complex plural marker with its eight different forms using a dense sampling technique in a case study of a German boy. She discovered that even though the boy's error rate decreased as his command of the language grew, some degree of nontarget forms remained, showing that the transition from one stage to the other is not sudden. For example, the little boy was obsessed with trains, but even after many correct plurals *Bahnen* he produced *Bahne* at a later point in development. Mariscal (2009) also showed that a mixture of target and nontarget forms is normal in development. She followed children under three years of age longitudinally on their development of a particular grammatical feature: gender agreement in the Spanish noun phrase. The analysis showed that there was a great deal of variability for each child and variation among the children in this complex acquisition process. The great amount of variability diminished when the children moved more toward adult-like use of these forms.

The idea that high degrees of variability point to transitional phases can be most clearly seen in the work by Bassano and Van Geert (2007). They looked at the development of one-word (W1), two- and three-word (W2-3), and four-and-more-word (W4) utterances from two French children during their second and third years. Because there were two striking peaks of variability and a temporary regression or period of rapid growth in the proportions of W1, W2-3, and W4, they concluded that such a period of great variability was a strong indicator of a major transition in early language development in that these

transitions corresponded to critical points in grammatical development, which they took to be indicative of the emergence of simple combinatorial and syntactic stages of language successively.

Moreover, they pointed out that one part of the subsystem (such as W1) needs to develop to a certain degree before the next one (W2) can develop, which is called a precursor relation. Other parts of subsystems may compete and these relations may change over time. According to Lewis, Lamey, and Douglas (1999) subsystems interact in such a way that temporarily stable states self-organize out of the repeated and reciprocal interactions.

To summarize, studies in L1 have shown that some subsystems such as sentence patterns (W1, W2–3, and W4) and prepositions show peaks in target or nontarget forms, pointing to a clear transition stage before they stabilize. Also, it is clear that “old strategies” like nontarget forms do not disappear suddenly. Finally there may be different types of interactions between the different parts of the subsystem.

Variability in L2 Development

In the field of second language learning, variability has long been acknowledged and was studied especially in the 1980s. However, inspired by variationist research in sociolinguistics (Labov, 1963), these studies focused mainly on explaining the causes of this variability, such as the task conditions. Tarone (1988) reviews many of these studies from different theoretical perspectives and concludes that not all causes of variability have been explained. She therefore calls for more longitudinal studies to “show the way in which variation at a single point in time is tied to longitudinal development of an interlanguage” (Tarone, 1988, p. 137). This is precisely what variability studies within a DST perspective intend to do, but rather than focusing on the possible extraneous causes of variability, they examine the patterns of variability in order to gain insight into the developmental process.

One of the first to mention the variability without apparent causes in the developmental process was Ellis (1994). He found that after eliminating all possible factors that could cause variability, there was still some degree of “free variability,” variability that could not be attributed to any known linguistic, situational, or psychological factor. According to Ellis, an especially clear example of free variability is given by Cancino, Rosansky, and Schumann (1978), who found that their subjects made use of a variety of forms to express negation at each stage of their development. Ellis states that a general finding of these studies is that free variability occurs during an early stage of development and then disappears as learners develop a better-organized L2 system (Ellis, 1994, p. 137).

This type of “free variability” can also be observed in the following examples of Dutch 12-year-olds, from Verspoor, de Bot and Van Rein (2011), who are at the earliest stages of learning English. There is clear local variability in their ability to spell words. Within consecutive sentences they use different spellings for the same words:

Learner 1: We learn good English, but ist's very difficelt. I mean, it's a really diffecelt language.

Learner 2: sometimes a girlfrend rides with me, and some times I ride with her.

Learner 3: my new school ar verry fun. I have alot new friends maekt. the teachers are oke haha it was a joke she ar verey fun. you kan have fun with them.

These learners have probably heard the words and are not sure how to spell them, but as they become more exposed to the written language, they will probably recognize and remember the correct spelling. However, unlike Ellis we argue that variability can also be observed at later stages of the language-learning process, but then in different language subsystems. For example, once the learner has discovered how to form short simple

sentences, there may be a high degree of variability in the use of verb forms (e.g., subject-verb agreement). Once the learner can form short simple sentences, usually with a simple present tense, he or she may start experimenting with different verb tenses, and then a degree of free variability may occur in using these tenses correctly. For example, Learner 4 (a 14-year-old Dutch learner of English who is at a slightly higher level than the first three learners) is obviously attempting to use the past tense. Although there are errors in tense use, the learner uses a past tense form (*worked*) correctly at first, and then uses the present tense form (*laugh*) a bit further on in the same text.

Learner 4: Im my summer vacation I have met a boy that was so lovely. He worked in the supermarkt, and every time that I must bought something, He laugh to me. I am in love! I hope I see him every day!

So far, there are still few studies of L2 development that interpret patterns of variability from a dynamic systems perspective. Most studies that have been conducted so far are individually based illustrations. However, the findings they reveal are highly similar to the observations that were reported in the field of motor development and first language acquisition. Findings so far point to variability with peaks, regressions, critical moments, and different kinds of interactions among subsystems in a developing language system.

In a reanalysis of the Cancino et al. (1978) data, Verspoor, Lowie, and Van Dijk (2008) and Van Dijk, Verspoor, and Lowie (2011) showed that one of the learners, Jorge, displayed a classic developmental pattern of variability, which is rather similar to the patterns Bassano and Van Geert (2007) found. As Figure 2 illustrates, he used all four possible negative constructions (*No* verb, *don't* verb, aux verb and analyzed *do* verb) from the first time he was interviewed, but early on the more advanced ones occurred only a few times. The nontarget *No* verb construction as in "I no go" had a strong and significant peak in session 3, then dropped down quickly but did not disappear completely until session 12. The *don't* verb construction, which is a target form in "I don't go" but a nontarget one in "he don't go" was significantly overused between sessions 7 and 9. At that same time, the use of the more advanced aux verb construction as in "I am going, or I can't go" had reached a small peak and then reached another peak around session 15. Meanwhile, the use of the most advanced analyzed *do* verb construction is slowly increasing and peaks in our data set in session 20, around which time a more target-like distribution of the negative constructions seems to emerge.

To summarize, Jorge's negative constructions show a developmental hierarchy from less advanced constructions to more target-like ones (as Cancino et al. had predicted). It is also interesting to see that the strong fluctuations are almost like waves, with less advanced ones reaching high peaks that subside quickly but do not disappear immediately, and more advanced target ones emerging more slowly and reaching smaller peaks.

The Cancino et al. (1978) study followed six beginning learners of three different age groups over a period of about ten months. Visual inspection of the graphs in Van Dijk, Verspoor, and Lowie (2011) shows that the youngest learners (Martha and Cheo) like the teenagers (Juan and Jorge) showed clear peaks of nontarget forms before they were acquired, but the older learners used more different forms from the beginning. The two teenagers (Juan and Jorge) showed brief peaks of nontarget uses right before they started using the more target-like constructions, which point to the high degree of variability Thelen and Smith saw in kicking patterns at a transitional stage. The older learners (Alberto and Dolores), however, did not show any clear peaks, suggesting they had no "real" transitional phases. Moreover, unlike the teenagers, the older learners did not really change much over time and did not seem to have acquired target constructions. These findings together strongly suggest that the variability points to transitional stages and is indeed needed to progress.

Figure 2 Jorge's development of negative constructions in the Cancino et al. (1978) study

Van Dijk et al. (2011) also show that even though all the L2 learners went through similar consecutive stages as L1 learners in learning to form negative constructions, each individual had a unique path of development, none of which even resembled the “average” path (see Figure 3).

Figure 3 Individual pathways of the use of the Don't V strategy in the Cancino et al. (1978) study. Van Dijk et al. (2011)

Figure 4 Moving min-max graph of the developmental pattern of case accuracy (window size of five data points). © Spoelman and Verspoor (2010), p. 10

It could be argued that the individual differences found by Cancino et al. (1978) could be partly explained by the fact that the learners were of different ages (two 5-year-olds, two teenagers and two adults) and of different socioeconomic backgrounds, but even when learners of similar ages, similar exposure to the language, and similar tasks are followed over a number of sessions, they show individual differences in their patterns of variability in the many different subsystems of the L2. For example, Larsen-Freeman (2006) showed individual differences in developmental patterns in Chinese learners of English, and Caspi (2010) showed such individual differences in advanced learners acquiring vocabulary.

Peaks and regressions can also be observed in more advanced learners but then in the use of other subsystems of the language. Verspoor, Lowie, and Van Dijk (2008) traced the development of different subsystems of the language of a Dutch learner of English. Even though this learner was quite advanced at the outset of the study, a variability analysis showed some surprising interactions. There was an unexpected competition between two complexity measures: sentence length and the ratio between finite verbs and number of words, suggesting that the learner first made sentences more complex by means of finite dependent clauses and later by means of longer noun phrases and nonfinite clauses.

Spoelman and Verspoor (2010) looked at a Dutch beginning learner of Finnish, a language that is typologically very different from Dutch and is known especially for its complex case system. The variability analysis (see Figure 4) showed two stages, the first with a very brief, strong dip of incorrect uses in the acquisition of case endings (about 3.5%) then a leveling off of the percentage of errors to about 2% and after text 25, leveling off to 1.5%, and this level remained mainly due to two notoriously difficult cases.

When the variability analyses of different subsystems were compared, the Spoelman and Verspoor study also showed that the syntactic subsystem—which in turn has subsystems at the word, noun phrase, and sentence levels—started with the simple structures first and was taken over by the more complex structures. Word complexity and the other two measures of complexity at the noun phrase and sentence level seemed to emerge rather synchronously as they correlated significantly with each other, but the noun phrase and sentence level complexity had a negative correlation, and a closer look revealed that they competed with each other for a while, suggesting that at one period during development the learner was focusing more on one syntactic subsystem than the other. Finally, the analysis revealed that the interaction between accuracy and complexity changed over time. For the most part they seemed to grow simultaneously, but there were also periods

when they competed with each other, showing that over time the interactions between accuracy and complexity will change.

Caspi (2010) studied four advanced learners of English and traced the variability patterns in their vocabulary knowledge over 10 months. Considering four hierarchically ordered levels of vocabulary knowledge—"recognition," "recall," "controlled production," and "free production"—as subsystems of the language, she showed that whereas recognition and recall supported each other, recall and controlled production competed with each other to some degree. However, there was strong competition between the two most productive levels: controlled and free production. These interpretations were then simulated successfully, which suggests that the interpretations of support and competition were supported by the data. In a writing study concerning the same four students, Caspi looked at four subsystems in L2 writing performance—lexical complexity, lexical accuracy, syntactic complexity, and syntactic accuracy—and showed that they were also hierarchically ordered in the sequence given (just like the negative constructions in Cancino et al.) and dynamically interconnected. So together, the two studies lend support to the idea that variability patterns are valuable and meaningful in indicating underlying systemic processes, in this case of interactions between codeveloping aspects of linguistic knowledge.

Conclusion

To conclude, the patterns of variability that Thelen and Smith found in the development of motor skills and those that were found in L1 are also found in L2 development. By looking at degrees of variability within one subsystem of the language we may discover transitional phases as with the L1 learning of prepositions and L2 learning of case endings. By comparing variability patterns in different subsystems in a learner's language system we can discover how they affect each other over time as with word growth and plural formation in L1 and different syntactic subsystems in L2. Finally, the variability studies in L2 development showed not only variability but also variation. Thus, although the results so far are preliminary, they are promising and give rise to research questions that are worthwhile to investigate in future studies.

Variables

SUSAN M. GASS

Why are variables important? Variables identify ideas in research studies in terms of their roles, their definitions, and their measurement. In applied linguistics research, we often want to know the effect of one variable or even a combination of variables on another. For example, some might want to understand the effect of political stance on word choice. Others might wonder whether using captions on videos will help with comprehension—and, we might want to further investigate whether the effect of comprehension is the same depending on the closeness of the foreign language script to the native language script. In this second example, we have identified one variable as *video captions*, a second variable as *script relatedness*, and a third variable as *comprehension*.

Variables are not unique to applied linguistics research; indeed we encounter them in all aspects of our daily lives. We are dealing with variables when we have to decide which shade of blue sweater to buy, or what size of lettuce to purchase for dinner. Variables are qualities of someone/something that changes. In other words, they are characteristics that vary from object to object, from person to person, or—in the case of language research—from text to text. For example, individuals can be characterized by height, weight, eye-color, and native language. And texts can be characterized in terms of length, complexity of language, and mode of input (aural, written). All of these characteristics are variables, and each variable has a range of values by which it differs.

Roles of Variables

In the above example of video captioning, we wanted to determine the effect of video captioning on comprehension. In general research terms, we refer to these variables as *independent* and *dependent* variables respectively. The independent variable is the one that we believe may have an effect on the results; the dependent variable is the one we measure to see the effects of the independent variable; we are measuring the effect of captions (independent variable) on comprehension (dependent variable).

We can think of other research questions in applied linguistics that involve the effect of something on language learning. Some examples are given in Table 1:

When considering how to manipulate one variable to determine its effect on another, it is clear that we are dealing with different types of variables, those that are inherent traits of an individual (working memory capacity) or part of what a learner brings to the language learning context (anxiety induced by a testing situation). There is little that a researcher can do to manipulate these. On the other hand, a variable such as feedback type (implicit or explicit) can be manipulated in a research context.

There are many instances in which manipulation of the independent variable to understand its effect on a dependent variable may be influenced by yet another variable that is not a researcher's major interest. This leads us to the role of the *control* for variables. In applied linguistics research, obvious influences are proficiency and gender. With regard to gender, one can control for it by having an even number of males and females in a study; in the case of proficiency, one could have preestablished distinct proficiency levels.

2 VARIABLES

Table 1 Examples of independent and dependent variables

<i>Research question</i>	<i>Independent variable</i>	<i>Dependent variable</i>
Does working memory capacity have an effect on the ability to understand captioned video?	Working memory capacity	Comprehension of video
Does text anxiety affect performance on a listening test?	Measure of test anxiety	Performance on listening test
Do men or women learn more in a study-abroad context?	Gender	Amount of learning
Does implicit feedback result in better learning of relative clauses than explicit feedback?	Feedback type	Relative clause learning

Another way of controlling for these variables is to conduct a study only with males or only with females, or only with beginning level students or only with very proficient students. However, if one only deals with one level of variability, one loses power since results cannot easily be generalized.

The need to control for variables should be identified before one undertakes a study. This, of course, is not always easy, but there are certain aspects of language learning (such as proficiency) that will undoubtedly creep in. The significance (or lack thereof) of other variables can be determined from the extant literature, or even common sense. An example might be preferences such as whether an individual wears eye makeup or not. It is unlikely that wearing eye makeup would impact the results of a study that looks, for example, at the effect of feedback types on learning. However, one must carefully consider the literature relevant to the research area as well as completely understand the tools that are being used for measurement. While one might not consider eye makeup important, it can be a variable that has to be eliminated if one is doing research with eye-tracking machines. Controlling for variables is always a delicate matter.

A related role is played by *moderator variables*. This subclass of the independent variable may not be the main focus of the study, but may modify the relationship between the independent variable and the dependent variable in a way that is of interest to the researcher, such as script relatedness in our earlier example. As another example, consider the third research question listed above concerning the role of gender in a study-abroad context. A variable that might have an effect on learning in addition to gender could be the amount of language used during a study-abroad context. This could be planned for (moderator variable) or could become apparent to researchers as they begin to analyze their data. In applied linguistics, because one is dealing with humans in a social context, unplanned-for variables can come into play.

Unwanted variables that creep into a study are known as *intervening variables*. Whereas gender and proficiency can be regularly counted on as being variables to control for, there are others which one does not imagine are significant. An example was given above concerning eye-tracking experiments. In general, one would not consider makeup to be an important factor, but in fact, without a careful understanding of the equipment being used, one can imagine how this unplanned variable can intervene and influence the results, probably in ways unknown to the researcher. This would therefore compromise any interpretation of the results.

Operationalizing Variables

Any time one deals with variables, one has to appropriately operationalize those variables that cannot be directly measured. For example, if one is looking at onset of second language study, one can measure this variable using age (e.g., 6 years 2 months). However, there are many instances in which variables cannot be measured directly, and so they are *constructed* variables, or *constructs*. When we cannot measure something directly, we need to come up with a reasonable surrogate or working definition for the variable in question. This is known as an *operationalization*. As an example, proficiency is a construct that is not easily measurable. No two tests will give a precise measure and any test taken twice may have some fluctuation in test scores. So, how does one measure proficiency? One could give a test, but this is, of course, only an indirect measure. One could use years of study. This, too, is fraught with difficulty given differential performance by students. Because no measure is complete or perfect, a researcher needs to operationalize proficiency and convince the rest of the research community that this operational definition is valid. If one were to use years of study as an operational definition, we would probably want to make sure that the difference between two groups is sufficiently large (e.g., those who have studied for less than one year in a university context versus those who have studied for three years or more in a university context). Or, if a test is given, one would want to have enough of a separation between the scores of two groups. This latter could be done by doing a statistical analysis or by presenting scores on a standardized test that are unquestionably different (e.g., scores on the TOEFL iBT ranging from 60 to 70 in one group and from 100 to 110 in another group). As described below, operationalizations can use intervals, as with some test scores, or they can use categories that imply an ordering, as in the labels often used for proficiency (novice, intermediate, advanced, superior).

Types of Measurement

In quantitative research, the choice of statistical analysis depends on the types of measurement scales used for the variables in a study. There are three scales of measurement that are commonly used in applied linguistics research: *nominal*, *ordinal*, and *interval*.

Nominal scales are used for categorization and allow researchers to divide a variable into two or more groups. Often when dealing with nominal scales, researchers assign a numerical value for coding, and not for analytical purposes. If one were looking at individuals with different native languages, one could code each individual with (1) if her native language were Japanese, (2) if her native language were Italian, and (3) if her native language were Greek. These numbers only represent membership in one category or another, with no suggestion of ordering or magnitude of difference and no suggestion of any mathematical operation (e.g., averaging). When there are only two categories, such as male/female for the variable *gender*, this is called a *dichotomous* variable. Nominal scales are associated with *categorical* data.

The second type of scale, an ordinal scale, is one in which ordering is implied. Ranking of scores is an example. This is often the case with class rankings where one student is ranked number one, another two, another five, and so forth. Even though ranking within class is ordered, there is no implication of an equal distance between each rank order. Thus, the difference between student numbers 1 and 2 may not be the same as the difference between students 2 and 3.

Very often in language evaluation, judgments are holistic. When one rates oral tests, a score is given based on a particular scale, say from 30 to 60. If one student receives 30 and another 60, it does not mean that the student who received 60 is twice as good as the

4 VARIABLES

student who received 30. We do know that the one who received 60 is better than the one who received 30. Thus, an ordinal scale only orders individuals, but does not indicate how much better one is than another. For this we need the third type of scale, an interval scale.

An interval scale also represents the order of a variable's values, but unlike an ordinal scale, it also implies an equal interval between points. Most language proficiency tests represent ordinal scales because there is not an equal distance between points on the scale. However, one could think of a discrete item test of 25 items, with each item being one point. In this example, the score (1 to 25) represents an interval scale because measurable units, such as number of correct answers, implies an equal distance between each point on the scale. Both ordinal and interval scales are associated with *continuous* data.

To review, in our earlier example, video captions is a dichotomous categorical variable. In other words, it has two possible values: (1) captions appear, and (2) captions don't appear. Of course, this is overly simplistic because other variables are embedded in this variable, such as where they appear on the screen and what color they are written in. The second variable, script relatedness, can be measured using an ordinal scale, and considered continuous ranging from almost identical (Spanish and English), to moderately similar (English and Russian), to quite/very dissimilar (English and Arabic, or English and Chinese). The third variable, comprehension, can be measured using an interval scale, also continuous, potentially ranging from scores of 0 (no comprehension) to 25 (total comprehension).

Varieties of English in Africa

RAJEND MESTHRIE

English is an important part of the linguistic landscape of Africa, and a binding force at the level of transnational communication, especially in the sub-Saharan region. The form and functions of English on the continent vary, depending on the particular colonial history of different regions and the nature of the original contacts with speakers of English, which began in the 16th century. Africa exhibits a range of English phenomena from pidgin to second language (L2) to creole and “transplanted” first language (L1). The earliest significant presence of English is in West Africa, then Southern Africa, next East and North Africa. The language is to be found in all inhabited parts of the continent, with areas that were under French, Portuguese, or German influence now all finding it hard to resist linguistic globalization via English.

The earliest contacts between English speakers and the locals were informal and sporadic, without an expectation of a permanent settlement or of colonization (and therefore formal education) until centuries later. In this early phase pidgins and “broken English” (i.e., early-fossilized interlanguages) were the outcomes of contact. These would not necessarily be ephemeral: West African Pidgin English, whose roots lie in the 17th and 18th centuries, is today more widespread (in the Cameroons, Ghana, and Nigeria) than is English as an L2. Pidgin English in West Africa fulfills a range of functions, including that of *lingua franca* when no other language is available for the purpose, in plantations and multilingual urban marketplaces. It is also an important medium when young people gather, especially in schools and now at universities (Huber, 2004, pp. 869–70), with Pidgin English often considered by its users to be an informal variety of English, rather than the autonomous system that linguists consider it to be.

Two varieties that gained significance in West Africa (from about 1787 onward) were the forms of creole English spoken by manumitted slaves who were repatriated from Britain, North America, and the Caribbean. Krio was the name given to the English creole of slaves freed from Britain who were returned to Sierra Leone, where they were joined by slaves released from Nova Scotia and Jamaica. Liberia was established in 1821 as an African homeland for freed slaves from the USA. American rather than British forms of English continue to dominate in Liberia (see Singler, 2004). Todd (1982) describes four types of English in West Africa today: pidgin; English as a second language (ESL); standard West African English (mostly oriented to the UK, with the exception of places like Liberia); and Francophone West African English.

English settlement in East Africa was different. Whereas in West Africa local people had very little exposure to native speakers of English, giving prominence to pidgin English, in East Africa “native speakers were present in considerable numbers, had great influence in government and filled a higher percentage of teaching posts” (Hancock & Angogo, 1982, p. 306).

North Africa was generally less Anglophone, with Arabic being the dominant language. However, given that places like Egypt had “protectorate” status in the British Empire, English was not entirely foreign even here, and with globalization continues to spread after the age of empire.

2 VARIETIES OF ENGLISH IN AFRICA

South Africa provides the largest mother-tongue base for English in Africa, though even here the percentage has never been more than 10% since the earliest English civilian settlement of 1820. However, English continues to be a growing force in post-apartheid South Africa, and despite the constitutional avowal of 11 official languages, English has grown in significance at all levels.

It is as an L2 that English thrives best in Africa. Its role in governmental communication, formal education, writing, and international communication looms large in many countries (see Schmied, 1991, pp. 23–45). Linguistically the L2 varieties of English in sub-Saharan Africa are notable for the way in which they have become indigenized, showing significant influences at all levels of structure. Phonologically, for example, there is a tendency to avoid vowel lengthening, and to use a syllabic pattern that rarely reduces vowels to an unstressed form. Regarding syntax, there is large-scale agreement about the influence of the home languages and the effects of psycholinguistic processing in second language acquisition (SLA). There is another aspect to the ontology of English in Africa, namely its intertwining with local languages. Two types of contact effects are relevant here: (a) borrowing and (b) code switching and mixing. The use of English in “high” domains in colonial times over local languages has resulted in a new resource in many African contexts. Carol Myers-Scotton (1993) has shown how the marked versus unmarked use of different languages comes into play as speakers use their multilingual repertoires in resourceful ways. Code switching is done strategically to negotiate status versus solidarity and the rights versus obligations of interlocutors. English is often used in code-switched discourse to stress status and education over local solidarity.

Alamin Mazrui (2004) explores the impact of post-Cold War politics on language preferences in Africa. Post-Cold War politics have proven a setback for languages like French and Portuguese, with the influence of institutions like the International Monetary Fund (IMF) and World Bank exerting greater pressure for economic liberalization, which favors communication with the USA and the promotion of English. Furthermore, countries in which English was not a colonial language (Congo, Mozambique, Somalia, and Brurundi) face internal pressures to increase the use of English so as to maximize economic opportunities afforded by neighboring “Anglophone” countries like Nigeria, Kenya, and South Africa. As Mazrui (2004, p. 2) notes, this increased globalizing pressure goes beyond the usage of elites and governments in international communication: The language is becoming more widely spread across urban class lines.

Many postcolonial theorists argue that the hegemony of English should be contested and controverted in the interests of local communities (Alexander, 2000). Bilingual education with localized variations would seem the best choice for many countries. This desideratum has yet to be fulfilled, with parents’ expectations, the intrusions of globalization, and governmental (elite) inertia often getting in the way. Chinua Achebe (1975, p. xiv) wrote vividly of the “fatalistic logic of the unassailable position” of English in West Africa. Other scholars add that if the forward march of English seems inexorable, for many of the less privileged, it is “unassailable but unattainable” too (Alexander, 2000). Herein lies a major linguistic paradox with immense educational and socioeconomic ramifications for the continent.

Varieties of English in Asia

ANDY KIRKPATRICK

The earliest contacts between English speakers and Asians led to the emergence of pidgins, as in China (Bolton, 2003). Later, varieties of English in Asia matured and developed in British colonies and, in the case of the Philippine English, in an American colony. To give an idea of the timescale, the British established the Straits Settlement Colony of Penang, Malacca, and Singapore in 1848, while the Philippines became an American colony in 1898. These colonies were trade or exploitation colonies (Mufwene, 2001) and a major characteristic of such colonies was the amount of contact—and therefore language contact—between the indigenous populations and the colonizers. This language contact led to the development of Asian varieties of English, especially in places where English became institutionalized in some way, if not as an official language, then as a language of administration or education. The varieties of English in Asia can be distinguished from those that developed in the settler colonies of Australia and New Zealand, where the proportion of English speakers to speakers of indigenous languages was greater and where, generally speaking, there was less language contact.

The distinction between varieties has been captured in a “circles” classification proposed by Kachru (1992, p. 356), whereby the traditional Englishes and those of settler colonies are termed “inner circle” varieties and those that have developed in postcolonial settings are termed “outer circle” varieties. Countries in which English remains a “foreign” language are classified as being in an “expanding circle.”

By this definition, Asian varieties of English can be seen as outer circle varieties of English. Examples include the Englishes of the Indian subcontinent and those of Southeast Asia, such as Malaysian, Singaporean, and Filipino.

These varieties of English tend to pass through similar and comparable stages of development (Schneider, 2007). At the early stages, linguistic norms are based on the original variety of English and the local variety is considered inferior. Gradually, however, locally derived linguistic norms become socially acceptable and eventually become the standard, although there often remains considerable local debate over the suitability of adopting the local variety as the official classroom model. The final stage of development occurs when the local variety itself develops a number of different varieties, as can perhaps be seen in India and Singapore.

Varieties of English contain distinctive linguistic features. For example, speakers of a particular variety of English can be most easily identified from their pronunciation. However, a variety of English will also have distinctive vocabulary. As speakers of these varieties need to be able to talk about local items and cultural phenomena, new words are created in a number of ways. Words are often borrowed from local languages, or the meaning of words from other varieties can be adapted to suit a new context, or new words can be invented. Examples of each from Singaporean English are *kiasu*, a Chinese word meaning fear of losing, but used in Singaporean English to describe someone who is frightened of losing out; *adat*, a Malay word referring to traditional custom; *alphabet*, which means a letter of the alphabet in Singaporean English; and *lessen terbang*, which combines the local representation of the English word “license” and the Malay word for “flying” to mean an illegally obtained driving license.

Grammatical features can also be distinctive. Perhaps the most iconic features of Singaporean and Malaysian Englishes are the use of discourse particles, but it needs to be stressed that these are associated with colloquial rather than educated and written varieties (Platt & Weber, 1980; Low, 2010). The use of discourse particles is interesting as they represent influence from local languages, but it is not easy to determine precisely which local language provides which discourse particle. The influence of local languages and language contact is the subject of much current debate. While it seems clear that local languages influence the grammatical features of Asian varieties of English, there are a number of nonstandard forms that are shared across different varieties, but whose speakers speak different languages. Thus the relative influence of the typology of the speakers' L1s and possible universal motivations toward syntactic simplification and regularization (as in the simplification of the system of verbal inflections and the move toward a preference for regular past tense marking) are topics of great interest to linguists (see Mesthrie & Bhatt, 2008; Filppula, Klemola, & Paulasto, 2009; Kortmann, 2010).

Speakers of Asian varieties of English can also adopt local cultural norms. Thus they may prefer to approach a topic in what might appear, to speakers of American English for example, a roundabout way, as it is considered somewhat impolite to broach a topic directly.

While it is difficult to give precise figures, the number of Asian speakers of English has been estimated to be more than 800 million (Bolton, 2008) with more than 300 million learners of English in China alone. This is significant, as China was traditionally classified as an expanding circle country in which English played the role of a foreign language. However, as China emerges as an important economic and political power, this is changing. China's membership of international organizations such as the World Trade Organization and its hosting of the Olympic Games in 2008 and the World Expo in 2010 are examples of how the need for English is becoming increasingly apparent. English is now taught as a compulsory subject from primary school, and prestigious universities offer certain courses, especially at postgraduate level, through English. In Hong Kong, now a Special Administrative Region of China, six of the eight government-funded universities are English-medium. This increased use of English in China has led to recent attempts to codify the Chinese variety of English (see Xu, 2010), a variety that has developed, not from a colonial past, but through the need to participate in today's globalized world. Similar developments can be seen in Korea and Japan, countries traditionally classified as belonging to the expanding circle, but where English is now the most frequently learned foreign language.

The increasing use of English in Asia has led to its becoming the regional lingua franca (Kirkpatrick, 2010). The 10 Asian countries comprising the Association of Southeast Asian Nations (ASEAN) have made English the official and sole lingua franca of the Association. This means that all ASEAN official communication is conducted through English. This policy is likely to advantage those who speak a variety of Asian English (e.g., the Filipino and Malaysian delegates) and disadvantage those whose English may be less fluent (e.g., delegates from Laos and Cambodia). However, the official status now accorded to English in ASEAN and the development of a Chinese and other varieties of English is likely to add further impetus to the development of new Asian varieties of English and its use as a lingua franca throughout the region.

Varieties of English in Cameroon

ERIC A. ANCHIMBE

In 1976 when Mbassi-Manga's paper "The State of Contemporary English in Cameroon" was published, there was no—or he made no—distinction between Cameroon English and Cameroon Pidgin English. Both were treated in a continuum stretching from Pidgin to educated English. Today, more than 34 years after, these two languages, initially treated as varieties of the same language, English, have not only expanded in terms of system-based consistency but have also evolved into many different varieties. Above all, their functions and number of speakers have increased tremendously—with both having native speakers (see Mbangwana, 1983; Schröder, 2003; Anchimbe, 2008). Later studies, especially Todd (1982) and Masanga (1983), focused more directly on Cameroon English, illustrating its features and delimiting its acceptable users. Other recent significant works on the variety include: phonology (Simo Bobda, 1994), syntax and morphosyntax (Sala, 2003; Mbangwana and Sala, 2009), lexical composition (Anchimbe, 2006a), intonation (Talla Sando, 2006), lexicography (Kouega, 2007), and ethnolects (Fonyuy, in press).

"Cameroon English" (CamE) is that variety typical of Cameroon, that is, English as it is spoken with a Cameroonian ecological flair both at the level of the system (grammatical norms) and at the level of social interaction (pragmatic norms). This entry focuses on system-based varieties of, and varieties within, CamE. By system-based varieties reference is made here to varieties identifiable especially through their grammars and domains of use. Varieties within CamE include ethnic and social variation, mostly at the level of accent and vocabulary. However, when we talk of CamE varieties, it is to be understood that most speakers speak more than one depending on the context of interaction and the goals to be achieved. For instance, speakers easily shift between their sociolects or ethnolects and the standard CamE accent.

System-Based Varieties

As far as standards of the language are concerned, two major varieties could be identified in Cameroon: the institutional variety (InsV) based on British English, and the communal variety (ComV). According to Sala (2003, pp. 140ff.) the institutional variety is the imposed (exonormative) variety acquired in school, "which hardly goes out of the classroom setting that engenders and regulates it." It is marked by formality and is used in formal contexts like education, media, administration, politics, and law. The communal variety is less subjected to the formal requirements of the classroom and is generally unaffected by the prescriptive corrections of teachers. For Sala (2003) it is the innovative (indigenized) variety—what he later terms "community English" (Sala, 2006, p. 61)—since it "is acquired in the greater English-using community showing a great deal of creativity and acculturation to local norms" (Sala, 2003, p. 75). It is, therefore, moving away from the exonormative norm and establishing an endonormative norm—what is referred to in the literature as Cameroon English. Here are some differences between the two.

At the level of conceptualization, the InsV sticks to denotational meanings and word order (1a) but the ComV reflects more pragmatic ways of communication (1b). Example

2 VARIETIES OF ENGLISH IN CAMEROON

(1) is said as an excuse for taking leave of someone. (1a) expresses the complete idea but (1b) rather captures the return, not normally supposed to take long.

- (1a) I will be back soon.
- (1b) I am coming.

The insertion of a subject pronoun in the object position as in (2b) is common in the ComV. For Mbangwana and Sala (2009) it signals obligation, that is, the subject is obliged to do the action. It shows that the ComV, influenced to some degree by the indigenous languages, fills the object position even when it is supposed to be empty in the InsV.

- (2a) We are going home.
- (2b) We are going *us* home.

The passive voice in the ComV is formed using a dummy “they.” (3b) is indeed the ComV version of (3a), the InsV sentence. In this function, “they” has no antecedent, is nonreferential, and has no anaphoric referent.

- (3a) My umbrella has been stolen.
- (3b) *They* have stolen my umbrella.

Varieties within Cameroon English

Two types of varieties are of interest here: ethnic and social varieties. First, ethnic languages, generally acquired as L1, exert influences on their speakers’ production of English. Certain vocalic and consonantal features stand out clearly when members of certain ethnolinguistic groups speak English. Some of these have been stigmatized given that they sound differently from the mainstream CamE accent. Below are examples of phonetic variation from three ethnolects.

Nso English (NsoE) accent, identified with speakers of Lamnso, produces the RP diphthong [əu] as the back vowel [u] as shown in (4a), making “bowl” and “bull” homophonous. It also monophthongizes the RP [eɪ] to [i] as in (4b); and reduces RP [i:] to [e] as in (4c). Wimbun English accent, like NsoE, also monophthongizes [eɪ] but rather to [ɛ] as in (5). For more see Tamfu (1989) and Yusimbom (1992).

	Word	RP	CamE	NsoE
(4a)	bowl	[bəʊl]	[bɒl]	[bul]
(4b)	name	[neɪm]	[nem]	[nim]
(4c)	meat	[mi:t]	[mit]	[met]
(5)	name	[neɪm]	[nem]	[nɛm] (Wimbun)

Bakossi English (BakE) accent, that is, speakers of Akoose, is noted for its consonantal features. BakE does not distinguish between the voiced and voiceless counterparts of the interdental affricate. Both are realized as voiceless, making “church” and “judge” homophonous (6a, b).

	Word	RP	CamE	BakE
(6a)	judge	[ʤʌʤ]	[ʤɔ:ʤ]	[ʧɔ:ʧ]
(6b)	church	[ʧɜ:ʧ]	[ʧɔ:ʧ]	[ʧɔ:ʧ]

Second, social varieties are normally adopted by choice, and often make use of special in-group vocabulary. Two varieties immediately come to mind here: status mother tongue (SMT; Alobwede, 1998) and prestige foreign tongue (PFT; Anchimbe, 2004) varieties. The former refers to children who are brought up with English as L1, and who are supposedly monolingual in it. They speak the language with a clear, nonethnic and sometimes slightly foreign accent, often not their own choice but rather their parents'. These are children from rich, upper-middle-class families whose parents can afford English-only (international) schools.

The latter group is made up of youths who intentionally adopt foreign accents for social esteem. The audiovisual media and the Internet have been instrumental in spreading American pop culture to this group (see Anchimbe, 2006b). They use American slang, swear words, and a rhotic accent to suggest they have been abroad. Expressions common to them are: "hey men/guys," "what's up," "you guys," "shit," "mother-fucker," "what the hell/fuck," "you know," and the use of "men" after every few words.

On Varieties and Standard

The standard of CamE is only strong enough if speakers can identify it and bounce off other standards—social, ethnic, foreign varieties—against it. The identification of the above varieties is a sign of the consistent evolution of the CamE, and as its communal features spread, the indigenization process gains more roots, hence representing the Cameroonian ecology even more by the language. In the social varieties referred to above, while it is the parents of the SMT children who benefit from the pride attached to L1 English children, in the PFT case, it is the youths themselves who show off with their "superior foreign" identity.

Varieties of English in Nigeria

OLADIPO SALAMI

Introduction

Although opinions diverge as to whether or not there is a Nigerian English, it is generally agreed that it is possible to do a broad characterization of varieties of English in Nigeria. Jibril (1982), Awonusi (1986, 1988), Jowitt (1991), Bamiro (1994), Igboanusi (2002), and others have demonstrated also that Nigerian English is variable and that its variability is socially motivated.

Features of Nigerian English (NigE)

There are certain features that can be identified as common to speakers of this variety. They include the following.

Vowel and Consonant Features

vowel mergers: 'lip' and 'leap' are realized as /lip/; the vowels in 'cup' and 'pot' are realized as /ɔ/;

monothongization of diphthongs: 'day' is realized as /de/ while 'go' is pronounced /go/;

gliding of diphthongs: words as 'fire', 'liar', 'layer', 'iron', and so on are pronounced /faya/, /laya/, /leya/, and /ayon/ respectively;

loss of consonantal contrasts: the dental fricatives /θ/ and /ð/ are pronounced as alveolar stops /t/ and /d/ respectively as in 'thug' /tɒg/ and 'those' /dose/;

word-final consonant simplification and word-final voiced consonant devoicing as in: 'hand' /han/, 'post' /pos/, 'robe' /rop/, and 'leave' /lif/;

voicing of consonant clusters: /ks/ cluster is realized as /gz/ before vowels as in the words 'flexible' /flegzible/ and 'laxity' /lagziti/;

voiced alveopalatal fricative /ʒ/, absent in the NigE consonant subsystem, is realized as alveopalatal fricative /ʃ/ in words like 'pleasure' and 'seizure' which are pronounced as /pleʃɔ/ and /siʃɔ/;

insertion of vowels before syllabic consonants and nasals, as in: 'cotton' /kɒtin/, 'bubble' /bɒbul/, and 'riddle' /ridul/.

Spelling Pronunciation

There is the tendency in NigE to pronounce words according to orthography as observed in the pronunciation of /-mb/ and /g/ in 'plumber' as /plɒmba/ and 'sing' as /sing/. Words which have the letters 'p', 't', and 'h' (e.g., cupboard, castle, honest) are in NigE pronounced as: /kɒpbɒd/, /kastul/, and /hɒnest/ respectively. The past tense morpheme /-ed/ is pronounced as /d/ in the NigE as in 'kissed' /kisd/ or /kizd/ and 'worked' /wɒkd/. The pronunciation of plural morpheme /s/ is also pronounced as /s/ in NigE as found in 'eyes' /ais/ and 'doors' /dɒs/.

Stress and Intonation

Stress in NigE is largely syllable-timed and each syllable in a word has the same degree of prominence, thereby producing what can be termed “heavily accented speech.” For example, there is no distinction between the following sentences where the center of information shifts from the subject to the object since all the syllables will receive the same prominence: “DEBO kicked the ball” and “Debo kicked the BALL.”

Although in some of its disyllabic words NigE tends to assign stress to the penultimate syllable, this is not regular and thus there is little or no generalization that can be made in stress placement in this variety.

Intonation in NigE is also influenced by its peculiar stress patterns such that the grammatical information conveyed and attitudinal orientations of its speakers’ utterances are either often misunderstood or fall short of their intentions, especially in interaction with non-NigE-speaking audience. Thus as a result of the unsystematic operation of intonation in NigE, grammatical and attitudinal distinctions are often confused or lost.

Variation within NigE

NigE is heterogeneous and its differentiation derives from the factors of regional/ethnolinguistic background and the level of education of its speakers. Two broad regional varieties exist. These are Basic Hausa English, spoken in the northern parts of the country, and Southern English, spoken in the south. There is also a variety which, though used by a large majority of the population, is marginalized. This is the English-based Nigerian Pidgin.

Northern Nigerian English is characterized by the absence of dental fricatives /ð/ and /θ/ which are replaced by the alveolar fricatives /z/ and /s/ as in ‘though’ /zo/ and ‘that’ /sat/. It also replaces voiceless labial stop /p/ with labiodental fricative /f/ in such words as ‘people’ /fiful/ and ‘plus’ /flɒs/. The variety is further characterized by vowel epenthesis as shown in the words: ‘amendment’ /amendiment/ and ‘legislator’ /ledʒisileta/. It must be mentioned that the variety is not homogeneous as other ethnolinguistic groups in this region such as Kanuri, Idoma, and Tiv, among others, exhibit the influences of mother tongues which differ in structures from Hausa.

Southern Nigerian English exhibits vowel mergers (e.g., /au/ → /o/ as in /on/ from the word ‘own’). Other features include the absence of alveopalatal affricate /tʃ/ and the voiced fricative /ʒ/ which are replaced by /ʃ/ as found in the following words: ‘chicken’ /ʃikin/ and ‘seizure’ /siʒ/. This variety is also not homogeneous, with Izo speakers replacing voiceless alveopalatal fricative /tʃ/ with voiceless alveolar fricative /s/ as in such words as ‘ship’ /sip/ and ‘wash’ /wɒs/, while Efik speakers also replace voiced velar stop /g/ with voiceless /k/ as in the words ‘good’ /kud/ and ‘goat’ /kot/. Yoruba-English speakers tend to nasalize all vowels before nasal consonants as in ‘plumber’ /plɔmba/ and ‘can’ /kɔn/. Igbo English is particularly noted for the gliding of the diphthong /ɔi/ as in the word ‘oil’ which is realized as /ɔjəl/.

Lexical and Syntactic Features

The lexical stock of NigE does not differ largely from Standard British English but it contains cultural forms that are peculiar to Nigeria. Examples include the words “oil-palm” (palm tree that produces fruits for the local cooking red oil), “yam-mound” (a heap of sand where yam is planted), “branch” (to call at a place), and “globe” (electric bulb).

The syntax of NigE exhibits form-class shift, as in the sentences “He offed the light” (switch off) where “off” is used as a verb, and “Please on the radio” (tune in) where “on”

is also used as a verb. The use of non-count nouns is also a feature of this English variety as noticed in the sentences “The Doctor bought some equipments” and “The government is not providing infrastructures.” Other features are the use of stative verbs as event/dynamic verbs as in “I am hearing the music” and “I am smelling the odor.”

Nigerian Pidgin English (NPE)

This is a widely used variety especially in the south-south (Niger Delta) region where it is developing into a creole. Its phonology patterns relatively after NigE while its syntax is simple but makes use of serial verbs. It has in its lexical stock items from English and Nigerian mother tongues. Examples are:

Me no get *wahala*: I don't have any problem (*wahala*—Hausa)

Una wan chop the fud: You (pl.) want to eat the food (*Una/unu*—Igbo)

O ya mek Mary kom go: Let Mary begin to leave (*O ya*—Yoruba)

I dey go kari waka for bodi: I am going to take it along with me (serial verbs)

Conclusion

This brief discussion of Nigerian English has not considered the fact that the level of education of a speaker in any of the regions has significant influence on the nature of Nigerian English or the variety spoken. However, spoken English among the educated shows a stratification range from what is referred to as “Sophisticated Speakers” whose variety of Nigerian English approaches the RP or British Standard English and those at the extreme end whose variety is just passable. It may be pertinent to note that Nigeria is also beginning to experience the influence of American English, with Americanisms creeping gradually into written and spoken varieties of English in Nigeria today.

Varieties of English in South America

KANAVILLIL RAJAGOPALAN

Made up of 12 sovereign states and 3 major territories, the continent of South America belongs to the “expanding circle” insofar as the worldwide ascendancy of English as an international language is concerned. Or, in terms of the metaphor of four successive diasporas that Kachru, Kachru, and Nelson (2006) employ, the continent bears witness to the last diaspora. Contact with the Anglophone world is fairly recent, having been very sparse and sporadic up to the mid-20th century. In fact, this vast landmass was mostly isolated from the rest of the world, thus inviting the epithet of “a forgotten continent.”

It was only after the end of World War II and the emergence of the United States as the free world’s major superpower that the countries in the continent really turned to English. Until then French was the continent’s number one language of international communication. French symbolized cultural finesse and sophistication and hence was a valued asset coveted by the well-to-do and parvenus, but accessible only to a select few.

But the postwar period saw a sea change. Over the past few decades, there has been a mad rush and scramble to learn the English language. This is amply attested to by the fact that language institutes offering courses in English are springing up in their hundreds across the continent. There is today a widespread awareness that the language affords people the vital passport to better job prospects and with it greater social mobility. The prevailing mood was picturesquely summed up by a taxicab driver in Peru when he said: “*El inglés en el mundo de hoy es un mal necesario, lo necesitamos sí o sí*” [English is a necessary evil in today’s world, we need it, one way or another] (Niño-Murcia, 2003, p. 121, original italics).

The popularity as well as the spread of English is far from uniform across the continent. There are small pockets like the Falkland Islands where an estimated 3,000 or so strong population speak English as their first language. The Cooperative Republic of Guyana (formerly a British colony) has retained English as its official language, being the only member of the British Commonwealth in the region. Spanish is the predominant language on the continent, but Brazil, a country that occupies about half its landmass and population, speaks mainly Portuguese. In all these countries, English is as yet very much a *foreign* language.

Argentina stands out from the rest, thanks to its longer and closer contact with English than most other countries on the continent. Friedrich (2003, p. 178) describes the country as “probably the ‘most British’ of Latin American countries.” At the other end of the continuum are countries like Venezuela and Ecuador where English is yet to make any significant inroads.

It is as yet too early to speak of clearly distinguishable regional varieties of English in the countries of South America. What one does notice though is the presence of regional accents, the result of transfer of phonological features from the mother tongue of the speakers—in most cases, either Spanish or Portuguese. The difficulty in distinguishing between /b/ and /v/ by many speakers of Spanish and that between /r/ and /h/ by many Portuguese speakers come to mind immediately.

But if it is difficult to pin down different varieties of speaking English in South America on a horizontal axis, it is certainly possible to speak of discernible varieties on a vertical axis. These varieties range from a fine command and fluent speech at the uppermost rungs

of the social ladder to barely comprehensible and mostly monosyllabic speech at the lowest. Many members of the elite have had part of their higher education in the United States or the United Kingdom. For instance, Juan Manuel Santos, who was sworn in as Colombia's president in 2010, has studied at universities like Kansas, Harvard, and the London School of Economics. The same is true of many occupying the top echelons of bureaucracy in many other countries of South America. On the other hand, a street vendor in Bolivia or a taxicab driver in São Paulo can at best barely blurt out half-a-dozen stock phrases in English.

One complicating factor in the acceptance of English by the public at large in many countries of South America is the long-standing distrust they have entertained vis-à-vis the United States of America and its putative high-handedness in its dealings with its neighbors to the south (Horowitz, 1985). This often translates into stiff resistance to and often outright rejection of English (Rajagopalan, 2005, 2006, 2010). In many countries like Brazil, there are clear signs of ambivalence in the attitude of people toward English, occasionally leading to sudden outbursts of linguistic chauvinism and clamors for protecting national languages against outside influences (Rajagopalan, 2002, 2003).

Nevertheless, to be sure, these are passing phenomena and should be taken with a grain of salt when assessing the long- and medium-term prospects for English in South America. Judging by the demand for learning English amongst the youth that keeps growing exponentially right across the continent, there is every reason to believe that the language is destined to be a major influence in the years to come.

But it is misleading to conclude that this breath-taking spread of English necessarily implies the ultimate triumph of the language or the hegemony of Anglophone nations. The language that has been spreading all over the world in the last fifty years or so is arguably not English as it is spoken in the United Kingdom or the United States or any other English-speaking country. It is fast acquiring "local flavors" even as it serves as a means of wider communication. One striking example of this curious phenomenon is the use of *outdoor* in Brazil as a countable noun on its own to refer to a billboard ("hoarding" in British English)—presumably a shortening of "outdoor publicity." "World English" (McArthur, 2001; Rajagopalan, 2004) is nobody's mother tongue and belongs to everyone who speaks it in whatever capacity. Everyone is a stakeholder in it and has a vested interest in its future.

Varieties of English in the Caribbean

SHONDEL NERO

Origin and Definitions

The varieties of English spoken in the Anglophone Caribbean today reflect the linguistic contributions of the English-speaking explorers and settlers who exported the language from the British homeland to the region in the early 16th century, as well as the range of peoples that have inhabited the region for the past 400 years, either by birth (indigenous Amerindians) or forced transplantation through slavery, indentureship, or both (e.g., Africans from West Africa, Indians from India, etc.). Caribbean settlement and plantation life, which spawned the linguistic contact of British colonial masters with these various groups, became a major source of contribution to the lexicon of modern English. Thus, “within a century, Anglophone Creoles were to become its first distinct overseas by-products and joint ancestors of today’s Caribbean English” (Allsopp, 1996, p. xli). Because slavery and indentureship largely eradicated the original ethnic languages of the exploited groups, the contact languages—creoles and creole English—that emerged in the Caribbean became the vernacular, evidenced in a continuum of usage between creole and English, known as a creole continuum, which became publicly labeled as English because of the stigmatization of creoles.

In *The Oxford Companion to the English Language*, Lawrence Carrington (1992) defines Caribbean English (CE) as “a general term for the English language used in the Caribbean archipelago and circum-Caribbean mainland. In a narrow sense, it covers English alone; in a broad sense, it covers English and Creole” (pp. 191–3). Today, among Caribbean natives, there is still debate about whether to consider English-based creoles dialects of English or separate languages. Linguists, however, have long recognized the integrity of English-based creoles as languages in their own right. As Roberts (1988) notes, “The wide spectrum in Jamaica challenges the definition of a language in that it calls into question the extent to which two speech varieties in a society can differ and still be treated as belonging to the same language” (p. 9). Still, there is no sharp cleavage between the basilect (creole), mesolect (mid-range variety), and acrolect (the standard variety) in everyday language use in the Caribbean. Consequently, many of the grammatical, phonological, and lexical features of all these varieties are subsumed under the umbrella of CE, as evidenced in Allsopp’s (1996) *Dictionary of Caribbean English Usage*, the most comprehensive tome of CE to date.

Prototypical Features of Caribbean English

While there are obvious differences in the morphosyntactic, phonological, and especially lexical features of CE across the various Caribbean countries, there are prototypical features in everyday language use that span the region. Below are examples of general characteristics adapted from Allsopp (1996) and Roberts (1988):

Morphosyntax

- Pronouns are treated as separate entities allowing them to function flexibly in many positions and capacities (subject, object, etc.), for example, "I tell **she** fuh come" or "**Him** say she live in New York."
- Questions asked by rising intonation rather than subject inversion with an auxiliary verb: "You going?"
- Avoidance of passive voice: "The food eat quick" (The food was eaten quickly).
- Front focusing (for emphasis): Introducing and stressing the main verb of a statement first, then repeating it in the normal position: "Is sell you wan' sell me the car?" (You really want to sell me the car?).

Zero inflection for:

- Plurals if plurality already indicated by number: "Five **dollar**." If plurality is not indicated, use of plural marker "dem," as in "**dem** girl" or "dih girl dem" (the girls).
- Possession: "**John** house."
- Subject-verb agreement: "She **call** every day."
- Tense: "He **wash** the clothes yesterday."
- Negatives: "She **na/don'/ain'/neva** tell me."

Zero copula if:

- The predicate is an adjective: "She tall."
- Locative: "Mary in the yard."
- Verb is in progressive form: "He crying."

Pronunciation

While no general homogeneity in sound can be claimed, there is a distinguishable "West Indian" accent that includes the following features:

- A leveling of standard English (SE) diphthongs, such that "fear" and "fare" or "tour" and "tore" are pronounced as homonyms.
- "Ar" for "or": "marning" (morning).
- Consonants are articulated with strong force.
- Preconsonantal "r" as in "card" or "word," and final "r" as in "bar" or "tear" are always pronounced except in Trinidad, St. Vincent, and most other Eastern Caribbean islands.
- Most final consonant clusters are reduced: "burs" or "buss" for "burst" or "tes" for "test."
- Palatalization after the word initial "g" and "k" sound: "gyirl" (girl) or "kyañ" (can't).
- Dropping/adding of word initial "h": "'ouse" (house) or "hegg" (egg).
- Voiceless "th" as "t": "ting" for "thing."
- Voiced "th" as "d": "dem" for "them."
- Separation of syllabic pitch and stress, which means that accent and highest pitch do not coincide. Using numbers to represent high-low pitch, CE would say "teach.er" as (1'2) while SE would be (2'1). CE would say "cóndemn" as opposed to SE "condémn."

Lexicon

The lexicon across the Anglophone Caribbean is extremely varied, reflecting the particular geography, ecology, ethnic populations, and different European colonizers that controlled the countries at various points. The bulk of CE is based on an English lexicon, but with

local meanings. For example, “waiter” in CE means a “tray” for serving food; “tea” can mean “any hot beverage” or “breakfast”; “hand” means “the part of the body from the shoulders to fingers”; “a next” means “another.”

Caribbean English in Education

The use of CE in school, especially at the basilectal and mesolectal levels, has been a source of contention among educators for a long time. Because of the stigmatization of creoles, attitudes about its use in school vary from zero tolerance (eradication of the vernacular in school) to accommodation (selective use of the vernacular as a bridge to SE) to full bilingual education (use of both the vernacular and SE as a means of instruction). Linguists and educators have suggested a range of strategies for facilitating the literacy development of CE speakers in school (Nero, 2001; Craig, 2006; Devonish & Carpenter, 2007; Bryan, 2010). The continued poor performance of English-based creole speakers in school guarantees that this debate will continue, and that research and policy development are still needed to improve their academic performance.

Varieties of World Englishes

KINGSLEY BOLTON

Introduction

Over the last thirty years, the term “World Englishes” has been widely used to refer to the localized forms of English found throughout the world, particularly with reference in the Caribbean, West and East Africa, and many parts of Asia. From the early 1980s onwards, in various branches of linguistics, research, and publications on World Englishes have contributed to a paradigm shift in English studies. Over this period, there has been a growing recognition of “Englishes” in the plural, as in “varieties of English,” “international Englishes,” “new Englishes,” “English languages” and “World Englishes.” Of all these designations, arguably the most popular term currently in the literature is that of “World Englishes,” and the last three decades have seen the rise of this area as a site for scholarly research and publication, with three major academic journals—*English Today*, *English World-Wide*, and *World Englishes*—specializing in such studies, as well as numerous book-length studies dealing with research in this area.

Approaches to World Englishes

The notion “World Englishes” may be seen as having both a narrower and wider application. The narrower application of the term refers to schools of thought closely associated with the approach to the study of English worldwide pioneered by Professor Braj B. Kachru and a group of closely related scholars. The wider application of the concept subsumes many different approaches to the study of English worldwide (including varieties-based studies) ranging from the Celtic Englishes of Britain, through diverse varieties in the United States of America, Australia, New Zealand, and Africa to English in Europe and Asia, as well as the study of discourse and genre in those contexts where English is regarded as a second or foreign language. Elsewhere, it has been pointed out that research on World Englishes in the wider sense includes at least a dozen distinct approaches including those of English studies, corpus linguistics, the sociology of language, features-based and dialectological studies, pidgin and creole research, “Kachruvian” linguistics, lexicographical approaches, popular accounts, critical linguistics, and futurological approaches (Bolton, 2004, 2006). These approaches are illustrated in Table 1.

As early as the 1960s, the English studies approach was associated with such scholars as Randolph Quirk and others associated with the Survey of English Usage at University College London, including David Crystal and Sidney Greenbaum. The work of such UK-based scholars was complemented by the research and publications of a number of German scholars including Manfred Görlach and Edgar Schneider, as well as that of work in corpus linguistics, which again is closely associated with an English studies approach, as in the work of Greenbaum (1996), Nelson, Wallis, and Aarts (2002), and others.

Sociolinguistic approaches to World Englishes have included (a) “the sociology of language” (Fishman, Conrad, & Rubal-Lopez, 1996), (b) the “linguistic features” (and dialectological) approach (Trudgill & Hannah, 1982/1994), (c) pidgin and creole studies, and (d) “socially

2 VARIETIES OF WORLD ENGLISHES

Table 1 Approaches to World Englishes

<i>Approach</i>	<i>Focus</i>	<i>Timeline</i>
<i>English studies</i>	The analysis of varieties of English from a synchronic and historical perspectives, against a tradition of English studies (<i>Anglistik</i>), dating from the late 19th century, for example, the work of Otto Jespersen, Daniel Jones, and Henry Sweet.	1960s–present
<i>English corpus linguistics</i>	The accurate and detailed linguistic descriptions of World Englishes from a features perspective.	1990–present
<i>The sociology of language</i>	Research on English in relation to such issues as language maintenance/shift, and ethnolinguistic identity.	1960s–present
<i>“Features-based” approaches</i>	The description of English through dialectological and variationist methodologies. Situated against the long tradition of British and European dialectology.	1980s–present
<i>Kachruvian studies</i>	The promotion of a pluricentric approach to World Englishes, highlighting both the “sociolinguistic realities” and “bilingual creativity” of outer circle (and expanding circle) societies.	1980s–present
<i>Pidgin and creole studies</i>	The description and analysis of “mixed” languages and the dynamics of linguistic hybridization (beginning with the early work of Hugo Schuchardt, 1842–1927).	1930s–present
<i>Applied linguistics</i>	The exploration of the implications of World Englishes for language learning and teaching.	1960s–present
<i>Lexicography</i>	The codification of vocabularies of English worldwide, linked to particular postcolonial societies and issues of linguistic autonomy.	1980s–present
<i>Popularizers</i>	The publication of books on English worldwide aimed at a mass reading public.	1980s–1990s
<i>Critical linguistics</i>	The expression of resistance to the linguistic imperialism and cultural hegemony of English, in tandem with resistance to Anglo-American political power.	1990s–present
<i>Linguistic futurology</i>	The discussion of future scenarios for the spread of English and English-language teaching worldwide.	1997–present

realistic” studies of World Englishes (B. B. Kachru, 1992). The use of the term “World Englishes” to refer to a distinct approach to this subject is most closely associated with the work of Braj Kachru. Indeed, the origin of the term “World Englishes” can be located in the two conferences on English as a world language that took place in 1978, one in April at the East-West Center in Hawaii, and the second in June–July at the University of Illinois at Urbana-Champaign, and Braj Kachru and Larry Smith played a major role in both conferences. Throughout the 1980s, other conferences were organized through the auspices of such organizations as IATEFL, TESOL, the Georgetown University Round Table, and the East-West Center, so that by the mid-1980s “World Englishes” had emerged as a distinct area of study.

By the mid-1980s, a number of popular works intended for a general reading audience began to appear, including publications by Crystal (1997, 2004). Critical approaches were particularly stimulated by Phillipson’s landmark *Linguistic Imperialism* (1992), which

encouraged a strong interest in the politics of English, and has also informed the work of a generation of other critical scholars. The futurology perspective is best represented in research reports from Graddol (1997, 2006). Recent summaries of approaches to World Englishes include Bolton (2004, 2006), Y. Kachru and Nelson (2006), and Y. Kachru and Smith (2008).

The Kachruvian Approach

One construct in the Kachruvian paradigm that has been both influential and controversial has been the modeling of English worldwide in terms of the “three circles of English,” the “inner,” “outer,” and “expanding” circles (B. B. Kachru, 1985). The circles model was intended to represent (a) the *types of spread* of English worldwide, (b) the *patterns of acquisition*, and (c) the *functional domains* in which English is used internationally. The *inner* circle of the model referred to those societies where English is the “primary language,” that is, the United States of America, the United Kingdom, Canada, Australia, and New Zealand. The *outer* circle was conceived as representing postcolonial Anglophonic contexts, a numerically large and diverse speech community, including such African and Asian societies as Nigeria, Zambia, India, and Singapore. Despite such diversity, the outer circle communities share a number of characteristics, so that typically English is only one of the community languages in what are clearly multilingual societies, and English in such societies usually achieves some degree of official recognition as an official, co-official, legal, or educational language. At the functional level, English is utilized in “un-English cultural contexts,” and is used in a very wide range of domains both as an intranational and an international language, and as a language of literary creativity and expression. The *expanding* circle is defined as comprising those areas where English is an “international language” and traditionally regarded as societies learning English as a foreign language (EFL). Nations in the expanding circle at this time thus include China, Greece, Indonesia, Israel, Japan, Korea, Saudi Arabia, Taiwan, and the USSR (i.e., the former Soviet Union).

One particular strength of the World Englishes paradigm (the WE approach) as established by Kachru and colleagues has been its avowed pluralism and inclusivity. On this, Kachru argues that “the pluralism of English must be reflected in the approaches, both theoretical and applied, we adopt for understanding this unprecedented linguistic phenomenon” (B. B. Kachru, 1997, p. 237). Despite this, the WE approach has not been without its critics. Bruthiaux (2003), for example, argues that the three circles model has contributed to an overemphasis on geographically delimited dialects of English, and other critics have suggested that the Kachruvian approach has been politically naive in its enthusiasm to valorize postcolonial varieties of English. On this first charge, it has to be said that scrutiny of the Kachruvian journal *World Englishes* indicates that, over recent years, only a minority of *World Englishes* papers have dealt with “areal” studies of Englishes, while many other articles covered topics such as discourse and text analysis, the sociology of language, applied linguistics, contact linguistics, “features-based” approaches, critical linguistics, bilingual creativity, corpus linguistics, lexicography, World Englishes theory, English studies, and pidgin and creole studies (Bolton & Davis, 2006). On the second count, that of political naïveté, it might be noted that the WE journal was one of the first journals in the 1990s to give space to Phillipson’s linguistic imperialism thesis in the form of an early symposium on the topic, and that, crucially, one of the early founding texts for discussions of both “linguistic imperialism” and the “critical applied linguistics” was B. B. Kachru’s (1986) paper entitled “The Power and Politics of English.” This appeared some six years before Phillipson’s *Linguistic Imperialism*, and specifically discussed the “lingocide” of minority languages worldwide.

New Directions in World Englishes

One important innovation or extension of the World Englishes perspective in recent years has been work on English as a lingua franca (ELF). In recent years, there has been much academic interest in the use of English as an international language in such contexts as European universities, and transnational communication in the Asian region. This in turn has yielded a good deal of interesting research on the use of English in such contexts, including, with reference to Europe, major studies by such researchers as Seidlhofer (2005), Jenkins (2007), and, in Asia, an important study by Kirkpatrick (2010).

Perhaps one socioeconomic explanation for the emergence and salience of ELF studies in very recent years has been the increasing globalization of universities across the world, particularly in North America and Europe. Current statistics indicate that the United States is still the world leader in attracting international students, with nearly 600,000 international students registered in 2010, with the United Kingdom coming in second place with around 350,000. Perhaps less well known is the fact that Germany now has around 260,000 students, and France approximately 250,000, and that other European nations such as Holland and the Scandinavian countries also attract significant minorities of overseas students (*Economist*, 2010, p. 55). Many of these European students are now studying international master's courses taught through English, are enrolled as PhD students (supervised by English-speaking professors), or are even following undergraduate courses taught in English. In contexts such as these, it is hardly surprising that the default language shared by both faculty and students is English, regularly used in non-UK and non-US institutions by teaching staff with a first language other than English. There has been a good deal of controversy concerning the definition of the term "English as a lingua franca" amongst linguists, but, at one level at least, the ELF project might be explained in part by the desire of some scholars to free the discourse of English-language learning in the European context away from its "English as a foreign language" (EFL) straitjacket, to liberate discussion along the lines of the World Englishes approach. As Pakir (2009, p. 28) points out, "WE and ELF are similar in that they have four common working axioms: emphasizing the pluricentricity of English, seeking variety recognition, accepting that language changes and adapts itself to new environments, and highlighting the discourse strategies of English-knowing bilinguals." Indeed, the ELF project also owes something to earlier attempts to theorize approaches to "Euro-English" (Mollin, 2006).

Following this, it is of key importance to recognize that the most important achievement of the World Englishes project over the last thirty years or so has not simply been to legitimize the study of "new" varieties of English in terms of their linguistic features in particular locations, but, more dramatically and more radically, to change the discourse of English studies in comprehensive and profound fashion, in ways scarcely imaginable in the early 1960s. As may be seen from the range of studies surveyed in this entry, the discourses of World Englishes are not narrowly sectarian, but also allow for dynamic new strands of analysis and discussion, as seen not only by theorizations of linguistic imperialism, but also in Saraceni's recent work on the "relocation" of English worldwide (Saraceni, 2010). At its heart, the WE project remains dynamically inclusive and pluralistic, inspired by the belief that "World Englishes represents certain linguistic, cultural and pragmatic realities and pluralism, and that pluralism is now an integral part of World Englishes and literatures written in Englishes" (B. B. Kachru, 1997, p. 237).

Verbal Report

ANDREW D. COHEN

The performance of language ability (i.e., through listening, speaking, reading, or writing) involves cognitive processes that are not easily observable, nor are language learners' strategies for accomplishing these activities. Verbal report in its various forms has established itself as a useful means of obtaining sometimes one-of-a-kind data on the cognitive processes people use to perform first language (L1) and second language (L2) tasks (Cohen, 1991; Green, 1998; Gass & Mackey, 2000; Bowles, 2010). One especially productive field for verbal report applications has been language assessment. Green (1998) notes that "verbal protocols are increasingly playing a vital role in the validation of assessment instruments and methods [in that they] offer a means for more directly gathering evidence that supports judgments regarding validity than some of the other more quantitative methods" (p. 3). This author notes, in fact, that verbal reports are frequently used to address what she terms "one of the most fundamental questions" about language tests (p. 3): What is it that a test actually measures?

As rightly pointed out by Leow and Morgan-Short (2004), "all verbal reports are not equal" (p. 36). There are different types of verbal report data. One important variable is whether the verbal report reflects think-aloud data, introspection, or retrospection. In the case of think-aloud data, the subjects merely voice their thoughts without trying to analyze or explain what they are doing, while introspection implies that they report on what they think they are doing to accomplish a task. One way to distinguish these two is by describing think-aloud as *self-revelation*, while introspection in contrast constitutes *self-observation* (Cohen, 2000). In principle, self-revelation would more accurately reflect the actual thought processes.

So, while think-aloud and introspective verbal reports are collected as subjects perform a given task, retrospective verbal reports are obtained after the completion of a given task. The first two types of data collection are considered preferable since they do not tax the memory as much as do retrospective ones, which are more susceptible to reconstructive modifications. A caveat regarding think-aloud or introspective reports is that the process of collecting them may alter the task being undertaken because "the think-aloud data collection method itself acts as an additional task that must be considered carefully when examining learner performance" (Jourdenais, 2001, p. 373). Nonetheless, there is evidence that the way subjects approach tasks while thinking aloud is very much in keeping with how they approach tasks normally (see Ericsson & Simon, 1993). In corroboration of this view, Leow and Morgan-Short (2004) found that they were able to obtain introspective verbal reports in a study of L2 reading comprehension by adult readers without any detrimental effects.

Let us take a closer look at the three broad types of verbal report data (Cohen, 1987, 1991):

1. *Self-report*, where learners provide descriptions of what they do, characterized by generalized statements, for instance, about their language use strategies. For example: "When I read in an L2, I try to look for clues in the immediate context when I encounter words I don't know." Self-reports are retrospective and mentalistic in nature.
2. *Self-observation*, which is the inspection of specific, not generalized, language behavior, either introspectively (i.e., within 20 seconds of the mental event) or retrospectively.

2 VERBAL REPORT

A further distinction would be between *immediate* retrospection (i.e., within an hour or so of the mental event) and *delayed* retrospection (say, up to a week or more after the event). Here is an example of immediate retrospection: "What I just did was to quickly skim the next several paragraphs to see if there were any clues as to the meaning of the word that I'm stumped on here. And sure enough, I found a handy synonym for that word, one that I did know."

3. *Self-revelation*, typically referred to as *think-aloud*, is characterized by the stream-of-consciousness disclosure of thought processes while the information is being attended to. For example: "Hmm . . . I wonder if these three words are actually a paraphrase of that word in the previous paragraph that I didn't recognize." Self-revelation is introspective and non-mentalistic in nature, and is seen as most accurately reflecting learners' cognitive processes (Ericsson & Simon, 1993; Cohen, 2000). Researchers need to be mindful of the fact that verbal reports may inadvertently comprise a combination of these different types (Radford, 1974; Cohen & Hosenfeld, 1981; Cohen, 1987), and so, if the intention is to use only one type, care must be taken in controlling for the type of data collected.

Oral interview or written questionnaire items that prompt respondents to describe the way that they usually learn language and perform what they have learned tend to elicit self-report data. Self-observation data would entail reference to some actual instance(s) of language behavior. For example, recollection of how L2 readers figure out what a word means in a given text would count as retrospective self-observation. Self-revelation or think-aloud data are only available at the time that the language event is taking place, and the assumption would be that the respondent is simply describing, say, the struggle to determine what a word means in context. Any thoughts that the respondent has that are immediately analyzed would constitute introspective self-observation. For example: "Now, does *sensible* in Spanish mean 'sensible' in English or does it have some other meaning? Let me see . . ."

Think-aloud and introspective protocols have the advantage of giving a more direct view of what language users do at the moment that they are doing it (Cohen, 1987). Retrospective interviews, in turn, provide an opportunity for investigators to ask directed questions to gain clarification of what was done. If data are also collected during the performance of the task as well, then the retrospective data can serve as a means for clarifying and amplifying the picture.

In the past there was a concern not to instruct respondents in verbal reporting so as not to bias the nature of the data. But anyone who has been faced with analyzing transcriptions of undirected verbal report protocols has seen how such data may well be too general and incomplete. So, even methodological hard-liners like Ericsson and Simon came out in favor of instructions to the respondents so as to make the verbal reports more complete (1993, p. 11). Not so surprisingly, then, many studies now do include instructions to elicit particular cognitive behaviors, with researchers cueing different processes depending on the study. Not only has it proven effective to have respondents receive specific prompts as to what to verbally report about, but it has also been seen that instruction in how to provide verbal report for a given task improves the quality of the data. Ericsson and Simon (1993) found that, to ensure that the verbal report does not interfere with the task at hand, there must be warm-up trials (after the instructions) with tasks that yield easy-to-analyze think-aloud, introspective, and retrospective reports.

Likewise, Green (1998; see also Cohen, 2000) underscored the need to ensure that "as much valid and complete data as possible are collected," and consequently highlighted the importance of orienting subjects to give quality verbal reports (p. 41). In her summary of key steps in collecting verbal report data, Green included the following:

- Prepare the subjects: Give “clear and unambiguous instructions” (p. 41).
- Brief the subjects: “Brief individuals on what is required of them and explain the procedure that is to be used” (p. 41).
- Practice the technique: “Give individuals some practice tasks to familiarize them with the technique” (p. 42).
- Practice the task: “Provide individuals with practice in the chosen procedure on the task . . . that will form the focus for the study” (p. 42).
- Give feedback: “Provide feedback on thinking aloud . . . performance” (p. 42).

The collection of verbal report data usually starts with an orientation session whereby respondents learn about verbal report and about how to provide it in the given context. They usually see or hear a model of someone performing the verbal report in the intended manner, and then ideally engage in a warm-up task (Bowles, 2010, chap. 4). The actual verbal report data can be elicited in a host of different ways, depending on the type of verbal report being elicited. For example, the data can be gathered by the subjects themselves, in the form of responses created as an audio file (say, while reading a text in a language lab), as written responses to a questionnaire (say, while engaged in writing an essay), or as journal entries (say, while strategizing about how to organize a talk to give in class). It may be advisable to have the verbal report in the subjects’ L1.

More common than having respondents collect their own verbal report data is to have the verbal report prompted by an investigator, especially when there is value in prompting for specifics, in order to facilitate subsequent data analysis. After an extensive review of the verbal report literature, Pressley and Afflerbach (1995) concluded that prompting respondents to use particular processes may be necessary: “It is reasonable to prompt [processes] in order to assure that a sample of the target processes will, in fact, be observed” (p. 133). One specific type of prompted verbal report, popular in the research literature, is referred to as *stimulated recall*, and entails “a prompted interview, for example, watching a video of an event, listening to an audio recording of an event, or even seeing a piece of writing just completed” (Gass & Mackey, 2000, p. 13). In reading studies, verbal report often entails having researchers cue different processes, such as the way readers summarize, make inferences, or attend to stylistic differences.

With regard to analysis of the data from verbal report, it will depend on the type of verbal report involved, the quantity of data, the way that the data were collected, and the immediacy of the verbal report. There may be value in having subjects listen to their own verbal report in order to clarify unclear points in the data (see, for example, the study by Nyhus, 1994, described in Cohen, 2011, pp. 104–5). Bowles (2010, chap. 5) provides guidelines for data analysis issues, such as how to code the data. In addition, data analysis software packages such as ATLAS.ti provide a means for qualitative analysis of unstructured data, particularly when working with larger bodies of textual and audio or video data.

As to research results using verbal report, numerous studies have employed verbal report data to determine the strategies that students use in language performance (see White, Schramm, & Chamot, 2007). Perhaps the bulk of these studies have been conducted with L2 readers (see Singhal, 2001, for a review). Verbal report measures have helped determine, for example, how respondents actually take reading comprehension tests, as opposed to what they may be expected to be doing (Cohen, 1984, 1994, pp. 130–6). Studies calling on respondents to provide immediate or delayed retrospection as to their test-taking strategies regarding reading passages with multiple-choice items have, for example, yielded the following results:

- Whereas the instructions ask students to read the passage before answering the questions, students have reported either reading the questions first or reading just part of the article and then looking for the corresponding questions.

4 VERBAL REPORT

- Whereas advised to read all alternatives before choosing one, students stop reading the alternatives as soon as they have found one that they decide is correct.
- Students use a strategy of matching material from the passage with material in the item stem and in the alternatives, and prefer this surface-structure reading of the test items to one that calls for more in-depth reading and inferencing.
- Students rely on their prior knowledge of the topic and on their general vocabulary.

These findings from the study of test-taking strategies illustrate the unique perspectives on learners' performance that can be obtained through the use of verbal reports. Such qualitative findings are useful on their own or as a complement to quantitative results.

Video Documentation and Analysis in Literacy Research

JUDITH GREEN AND DAVID BLOOME

Understanding the use of video documentation and analysis in the study of literacy requires going beyond the procedures and practicalities of the techniques and equipment across disciplines. The challenge this diversity raises is reflected in the differences in epistemological and ontological perspectives that constitute the logics of inquiry for studying literacy. These differences are visible in theories used, questions asked, objects of study, the nature of video documentation/collection processes used, and ways of analyzing video records, as well as the tenets of evidence and ways of reporting findings from the analysis of the video records (see Strike, 1989).

We begin our discussion of video documentation and analysis by describing some of the directions taken by literacy researchers across disciplines. Our purpose in describing different directions is to emphasize the need for transparency in reporting the underlying ideological assumptions and decision processes involved in video documentation and analysis. This exploration is necessary in order to understand what counts as literacy within a particular program of research. After describing a range of epistemological and ontological issues involved in video documentation and analysis across disciplines, we explore four conceptualizations of literacy underlying different approaches to video-enabled literacy research.

Variation in the Use of Video Documentation and Analysis Across Disciplines

To examine variations in the logics of inquiry guiding literacy research, we begin by examining the historical roots of the use of film and audio recordings in anthropology, linguistics, sociology, and education. In this section, we present a brief discussion of these roots, highlighting directions currently being taken in the study of literacy across disciplines that make visible what types of investigations video facilitates that may not be possible without the use of video. Within anthropology, researchers have used visual media (film and video) to capture images and events of the everyday life of one cultural group for display to another cultural group (see Ball & Smith, 2001; Collier, 2001; Heider, 2006; Pink, 2007). These records have often become part of historical archives that are used by the original researcher or made available to others. Researchers, within anthropology, seek to examine how language and literacy processes are socially and linguistically constructed and function within a community, who has access to these practices, how use of particular language and literacy practices are consequential for members within and across social groups, among other social and cultural dimensions of everyday life. For these researchers, video is more than a means of documenting communicative practice of diverse groups of speakers; it affords a means of examining social, cultural, and linguistic processes and practices through which members of social groups construct, and embody, what counts as language and literacy.

Video documentation provides a way of capturing how interlocutors materially respond to each other verbally and nonverbally, how they index various contexts of their interaction, and how they concertedly construct shared frameworks for the use of written language. From this perspective, literacy processes and practices are not decontextualized, autonomous skills visible on a video, but rather a conceptual and ideological system constructed in and through interactions among members of a sustaining social group (Street, 1995). Within linguistics, researchers have used video documentation to capture the subtleties of speech and speech events (including phonological variation, nonverbal behavior, and prosody) as well as the ways in which verbal, prosodic, and nonverbal behavior are layered and interact with each other. Some linguists have also used video documentation to study the use of language in naturally occurring settings (Schiffren, Tannen, & Hamilton, 2003) as well as looking at how phenomena such as identities are linguistically constructed and indexed through locally created labels, stances, styles, and linguistic structures and systems (Bucholtz & Hall, 2005).

Within sociology, researchers have used video as a basis for capturing and analyzing ways members socially accomplish everyday life. Although representing different traditions within sociology (e.g., microsociology, ethnomethodology, conversation analysis), these sociologists seek to understand and examine, for example, how children develop socially in and through language-in-use (Corsaro, 1985), what counts as literacy as socially constructed in and through the coordinated interactions among members of a social group (Heap, 1980), and how talk-in-interaction (or language-in-use) is constitutive of everyday life (Mehan, 1993).

Educational researchers have drawn on, adapted, and contributed to anthropological, linguistic, and sociological theories and approaches to video documentation and analysis by analyzing language and literacy practices and events of everyday life in educational settings. They have focused on how the moment-by-moment verbal and nonverbal spoken and written language creates and constrains opportunities for academic literacy learning and related processes such as identity formation, peer relations, and power relationships (Bloome, Carter, Christian, Otto, & Shuart-Faris, 2005). Educational researchers have also used video documentation and analysis to study how language is used to construct particular in situ definitions of literacy, that is, literate practices, within and across times and events. They have also explored how different theoretical perspectives guiding video analysis require different sources of evidence for warranting claims (Heap, 1995), supporting the call for epistemological transparency. Goldman takes this argument further by proposing the term "multiloguing" (1998, p. 32) to emphasize the importance of proactive efforts in obtaining multiple interpretations, (Green & Harker, 1988; Goldman, Pea, Barron, & Derry, 2007), thus providing a way of moving beyond recognition that any particular approach provides only a partial understanding of literacy.

Video Documentation: Issues of Transparency

In this section we examine issues and debates on transparency in the use of video as a resource for documenting and analyzing everyday life events. Central to these debates is the question of how to conceptualize what is recorded on a video record. The answer to this question is complex and is associated with conceptual shifts that have taken place across disciplines since the 1960s, including the interactional turn in education and the social sciences, the linguistic turn in philosophy, anthropology, and cognitive science (Clifford & Marcus, 1986), and the interactional turn in education (Erickson, 2006). Each of these conceptual turns has contributed to debates over how interpretations of what is recorded on video are conceptualized and warranted. Given the limitations of space, we

have elected to focus on one turn, the *interactional turn*, to construct an illustrative case of the theoretical and epistemological directions related to video documentation and analysis. Erickson argues that the “interactional turn” (2006, p. 177) in educational and social science research created a need to capture the complexities and nuances of social interaction in order to understand how knowledge, social identities, and educational processes, such as literacy instruction and learning, are accomplished. Replaying of video recordings provides researchers with opportunities to focus on the minute details and subtleties of social interactional work among participants, enabling the researcher to add layers of description and analysis warranted by what is seen or heard on the recording. It also provides a basis for making visible the chains of action members use to signal to each other what they have heard, interpreted, and understood as well as what is socially significant.

Examining chains of action and the evolution of interaction within and across events provides an alternative to traditional analytic approaches in qualitative research that focus on identifying themes, cultural models, patterns, and norms through the constant-comparative method and grounded theory. Rather than identifying a social phenomenon and locating its recurrence, the underlying assumption is that people act and react to each other and what they socially construct may continuously change and evolve (Bloome et al., 2005). Similarly, the interactional turn has created a need to trace links between and among events to explore how and what students (and other participants) take up, adopt, and adapt from one event to inform their actions, directions, and understandings of patterns of life in subsequent events (Baker, Green, & Skukauskaite, 2008).

The interactional turn raises questions about the use as well as usefulness, and conditions of use, of video documentation and the role of the analyst. Collier (2001) has argued that although video records have been used as a stand-alone source of data, the usefulness of video documentation depends on the degree to which it can be contextualized by reference to other sources of data simultaneously collected that can locate the video record within a longer sequence of events and in a broader understanding of the cultural life of the people involved. Van Leeuwen (2001) also contrasts warranting based on the video image itself with warranting that extends intertextually to other texts and images to warrant underlying ideological meanings. These arguments raise questions about what a video is a record of, and what sources and analyses are necessary for warranting claims about the bit of life captured on a video recording. From a sociological perspective, Atkinson (1990) raises questions about what it means to engage in video documentation and analysis. He argues that video documentation tends to position the researcher as witness to the recorded event and tends to misleadingly frame subsequent accounts as objective and realist, removed from the subjectivities of memory, note taking, and narrating. Across research traditions, therefore, researchers have argued that video documentation is not a transparent means of data collection and analysis (Griffin & Schwartz, 1997; Goldman, 2007). The researcher decides on what to record and what to overlook, how to compose the visual frame in the camera, what counts as a beginning, middle, and end of an event, how to contextualize a captured event by what came before and after (Collier, 2001), as well as how directionality and coverage of the microphone should be configured. As such, video documentation is not only a means of data collection; it is simultaneously a tool of data construction reflecting the goals of the researcher, his/her logic of inquiry, and also her/his cultural subjectivities (discussed below). As Goldman and McDermott (2007) note:

Video records do not make analysis easier . . . [they] capture what individuals seemingly attend to, talk about, and do with what is at hand, and they allow, more crucially, an analysis of how all this is arranged with the most locally demanding and collectively constructed constraints of time and space. (p. 112)

Pink (2007) shifts the arguments to consider the impact of the researcher: "The ways in which individual ethnographers approach the visual in their research and representation are inevitably influenced by a range of factors, including theoretical beliefs, disciplinary agendas, personal experience, gendered identities and different visual cultures" (p. 39). To these subjectivities, we would add to Pink's list racial, ethnic, class, geographic, sexual orientation, and language identities, while also noting that such a list can never be comprehensive and is always evolving. We would also add issues focusing on the extent that use of video documentation was planned for use within the cultural group captured on the video, or for use with another cultural group (e.g., showing a video of classroom literacy lessons to participating teacher and students versus showing it to an audience of researchers who have no familiarity with that classroom). This decision raises questions about how the context of consumption (e.g., the audience to which the video will be shown) influences the context of production (the decisions of what to document, how, when, in what ways, for what purposes, with what means of production) (Tobin, Hsueh, & Karasawa, 2009). Each of these issues raises questions about the influence of the subjectivities of researchers and audience; recognition of subjectivities has led anthropologists and sociologists, among others, to call for a reflexive approach that makes transparent, not only how the researcher views the video as a record of visible literacy, but also how personal subjectivities influence the analysis and interpretation of literacy visible in the chain of actions among participants (see Atkinson, 1990; Pink, 2007). These arguments point to the need for researchers, and those who consume research, to consider how their views of what is recorded on video influence their representation and interpretation of "others" and how knowledge about others is constructed and validated in and through video documentation.

Video Documentation and Conceptual Approaches to the Study of Literacy

With specific regard to literacy research, for heuristic purposes we identify four conceptions of literacy as a "visible phenomenon." (Since researchers often incorporate multiple conceptions of literacy as visible phenomena in their studies, the examples here are merely illustrative.) The first derives from cognitive science. Literacy itself consists of various cognitive processes and although these processes are not visible themselves, the consequences of engagement in these cognitive processes are visible. Video documentation of literacy here focuses on analysis of the material actions in which participants engage, and the consequences of these actions, in order to gain insight into the nature of the invisible cognitive processes (Mercier & Frederiksen, 2008).

The second conception derives from cultural psychology. Literacy is viewed as a set of psychological processes that are realized both in the social/cultural world and in people's minds. Through participation in literacy activities, the individual acquires the shared mental processes and strategies represented in the cultural activity. Video documentation of literacy here focuses on the enacted psychological processes and their public representation inherent to, and visible in, the social and cultural activities in which people participate (Moll, 1992; John-Steiner, Panofsky, & Smith, 1994)

The third conception of literacy as visible derives from social and cultural anthropology, including ethnography of communication and microethnography. Literacy here is defined as any social event or social practice in which written language is more than a trivial aspect (Heath, 1980). Bloome et al. (2005) provide one approach to video documentation and analysis of literacy events that foregrounds how knowledge, meaning, social identities,

power relations, levels of social context, and cultural ideologies are constructed through how people act and react to each other. Although video documentation provides a mechanism for careful and reflexive analysis of the actions people take to each other and to previous actions and events, the analysis depends on logics of inquiry locating meaning in how any act (i.e., an utterance, nonverbal behavior, manipulation of an artifact, etc.) reflects, and refracts, the meaning(s) of previous acts (Volosinov, 1973). Key to the conceptualization of literacy here is that any literacy act and event is not a thing in and of itself, but rather is situated as part of an evolving and multilayered social and cultural context. Given this conceptualization of literacy, video recorders are more than a tool; they become a partner with the researcher, interacting with and supporting particular actions (Baker et al., 2008). Throughout the research process, decisions are made about how, when, and in what ways the video recorder enters the data collection process, who engages with it for what purposes, yielding what kinds of records, and how other forms of documentation are collected and linked to the video as a potential resource.

The fourth conception frames video documentation as both the means of capturing the literacy act, and as a literacy act itself. There are two different theoretical derivations within this fourth conception of literacy as visible. The first is phenomenological, with a focus on video documentation itself as a way of defining and interpreting the world. The second derives from social activist research in which video documentation is viewed as a means of witnessing, as providing counter narratives, and as acting on the world. The use of video documentation here provides a way for people involved in a social institution, such as teachers in a classroom, to reflect on and analyze what is happening in their social spaces and how those social spaces might be modified (Rex & Schiller, 2009). For example, Pappas (1997) describes how video documentation of classroom reading events (the reading of a poem) provided a way for a collaborative research team of teachers and university researchers to focus on the language of a classroom discussion. By focusing on what was said, by whom, how, and in response to what questions and previous statements, they were able to critically analyze the structure of classroom discourse and to problematize taken-for-granted routines.

Concluding Comments

The discussion in this entry goes beyond the practicalities and impositions of the technologies, determinations of framing and units of analysis, contextualization, detailed layers of description, and reflexivity involved in video documentation and analysis. The challenges presented in this entry frame issues that are ontological and epistemological: how language and literacy are to be defined, how the relationship of emic (insider) and etic (external) definitions of literacy are to be structured, how multiple perspectives and multiple layers of analysis are needed to define what counts as literacy, how literacy accounts are laminated, what differences the difference across perspectives on analysis make, and how all of this is to be warranted in a transparent manner. Viewed in this way, each approach to analysis constitutes a language with a particular expressive potential about what counts as literacy in video-enabled research.

We gratefully acknowledge the thoughtful comments and suggested revisions from an anonymous reviewer. Whatever flaws remain are solely our responsibility.

Vocabulary Acquisition in Bilinguals

CRISTINA IZURA

Introduction

Ten years ago, at the age of 65, my father decided to learn English as a second language. He cautiously aimed at learning one word per day and began by writing English words on adhesive notes and sticking them to every single household item. At this learning rate his current vocabulary should comprise 3,650 words. This would be a considerable vocabulary size in view of the reported ability to understand 80 percent of English texts with vocabularies comprising between 2,000 and 3,000 of the most frequent English words (Nation, 1993; Meara, 1995). Whilst my father is still interested in learning English, his vocabulary knowledge has not reached his expectations and he often wonders, why? Learning method, age, lack of previous knowledge, and exhaustion of objects to label are likely contributors to his slow learning pace. These factors; age of acquisition, method of instruction, and characteristics of the vocabulary to be learned, have been commonly investigated as major determinants of vocabulary acquisition in bilingual speakers. Age of acquisition and the type of words to be learned will be discussed in the present review along with three of the best known models that account for bilingual development.

Age of Acquisition

The impact of age of acquisition in language development and overall attainment of first and second languages is a topic profusely investigated (for a review see DeKeyser & Larson-Hall, 2005). Lenneberg's (1967) proposal of a critical period for the acquisition of language is at the core of the modern debate. He suggested that learning a language from simple exposure, as observed in normal developing children, is severely limited in older adolescents and adults. The notion of a limited period of time for normal language development has received strong support from research in first language development. The evidence is often dramatic and fortunately limited to few cases of feral children such as "the wild boy of Aveyron" and "Genie" (Curtis, Fromkin, Krashen, Rigler, & Rigler, 1974; Lane, 1976) or deaf children of hearing parents such as "Chelsea" (Dronkers, Ludy, & Redfern, 1998). These types of studies are generally concentrated in ultimate language attainment and in this sense they consistently show that mastering the first language is jeopardized when young children are deprived of linguistic input (Mayberry & Eichen, 1991; Grimshaw, Adelstein, Bryden, & MacKinnon, 1998). The specific relationship between the acquisition of first language vocabulary and critical period has not received a high degree of attention. However, it is worth noting that no age limitations were described in relation to the vocabulary growth of Genie or Chelsea. Both vocabularies were reported as in continuous development albeit different in size and content than that of children at the same language developmental stage (Curtis et al., 1974; Dronkers et al., 1998).

The question of the existence of a "linguistic critical period" in relation to the acquisition of a second language has been inevitably posed and the observed differences have led to a distinction being established between the simultaneous or sequential learning of the two

2 VOCABULARY ACQUISITION IN BILINGUALS

languages. Simultaneous exposure to two languages from birth is known as *bilingual first language acquisition* (BFLA), while the sequential introduction to two languages can be referred as *second language acquisition* (Ellis, 2005).

The study of the similarities and discrepancies in the language development of bilingual and monolingual children is at the heart of BFLA research. At the lexical level, no significant differences have been observed between the two groups of children in relation to the time at which they reach key language milestones such as the production of the first word/s, rate of vocabulary growth, and the acquisition of the syntactic properties of the newly learned words (Genesee & Nicoladis, 2007). However, differences in the vocabulary size and vocabulary repertoire of each language have been found in those cases in which the bilingual child has a different frequency and context of exposure for each language (Pearson, Fernández, Lewedag, & Oller, 1997).

The linguistic limitations imposed by age at the time of learning a second language (L2), before or after adolescence, seem to vary depending on the component of language under scrutiny (DeKeyser & Larson-Hall, 2005). A number of studies have shown that in general the acquisition of native-like competence for phonology and syntax is bounded by critical periods of varying durations (Asher & García, 1969; Fathman, 1975; Johnson & Newport, 1989). Therefore, acquisition may need to start before the age of six if native-like phonology is to be achieved and before the age of 15 for morphology and syntax (Izura, 2003). The acquisition of second language (L2) vocabulary, however, has not been shown to respond to the limitations of a critical period. Bahrick, Hall, Goggin, Bahrick, and Berger (1994) examined the “critical-age hypothesis” by looking at the passive and productive English vocabulary of over 800 Spanish native speakers. All participants were Cuban or Mexican immigrants whose time living in a bilingual environment varied in a steady continuum ranging from 4 months to 50 years. Vocabulary knowledge was measured using a word recognition task, a category generation task, and an oral comprehension task. Results showed a continuous improvement in word recognition and category generation for 30 years after immigration. Also, in another comparison using the same word recognition and category generation tasks, bilingual participants performed equal or better than monolingual speakers of English. Finally, better performance in English as an L2 was observed for those who were older at the time of immigration. Bahrick et al. (1994) concluded that the notion of a limited time interval to learn an L2 might only be applicable to those aspects of language that do not benefit from L1 transfer. In the same line Davis and Kelly (1997) investigated the second language vocabulary of non-native English speakers and found no significant correlation between age and vocabulary knowledge. They argue that the acquisition of vocabulary might be an open-ended process (even words in the first language continue to be acquired through life) detached from time constraints at least for those aspects of vocabulary knowledge that are independent from syntax and phonological constraints.

Type of Words

Selecting the appropriate vocabulary to teach and learn is of vital importance to develop lexical competence. The majority of researchers agree that such vocabulary selections should adhere to a criterion that will fulfill the speaker’s language needs. Defining and operationalizing these “needs” is complicated even when individual differences, and therefore needs, are reduced by considering specific groups of L2 learners, for example, those learning English as an L2 for academic purposes.

It has been acknowledged that not all the words present in any given language (e.g., the vocabulary size of the English language has been estimated to comprise about 54,000

word families, Nation & Waring, 1997) are equally useful. One of the factors most commonly used to identify the most “useful” words in the language has been word frequency. Word sets containing high-frequency words are selected and then contrasted against the proportion of text comprehension they can provide. Following this method, albeit not strictly, the general service list comprising 2,000 headwords (West, 1953) and the Academic Word List comprising 570 word families (Coxhead, 2000) were created. Together these two lists account for more than the 85 percent of words present in academic texts and have been instrumental in the investigation of the words to teach and the words to test when assessing proficiency in second language learners (Nation, 2004). However, the impressive amount of text comprehension that can be accounted for by a relatively small subset of high-frequency words can be a misleading figure. It is hardly surprising that these “small” vocabularies cover the majority of the written text if we take into account that they are selected from corpora based in similar written material. In addition, although frequency measures are good indexes of vocabulary in use they do not fully respond to the learner linguistic needs. This is because printed frequencies do not always match the vocabulary present in the spoken language. For example words such as *mum*, *dad*, *bye*, and *trousers*, regularly used in everyday conversations, are not present in the general service list but *resign* or *postpone*, encountered less often, are.

There are also other relevant factors, often ignored in the selection of vocabularies, in need of consideration when teaching and learning a second language. For example, some types of words might be easier to learn than others and therefore should perhaps, be more profusely present at the initial stages of second language learning. De Groot and her colleagues carried out a series of studies addressing the effects of word types in learning. For example, Lotto and de Groot (1998) reported that high-frequency words and cognates, those words that are similar in form and meaning across languages (e.g., *trumpet* in English and *trompeta* in Spanish), were easier to learn than low frequency and non-cognate words. Better learning has also been reported for concrete and high image-ability words (Ellis & Beaton, 1993; de Groot & Keijzer, 2000).

A further question is whether there is an optimal amount of words to be learned at different stages in the acquisition process. Meara (1995) highlighted the fact that size matters and that the difference between knowing 500 words and knowing 2,000 could determine the rate of language comprehension and consequently of language development. He proposed teaching large vocabularies early on in the teaching programs in order to maximize language development. In support of Meara’s (1995) suggestion, a large number of studies have shown that words that are learned early in first and second languages are faster to be recognized and produced (Izura & Ellis, 2002, 2004). It has been called the age of acquisition effect and despite its name refers to the order rather than the age of word learning.

Models

Models of language representation, processing and acquisition provide the necessary framework against which empirical evidence can be assessed and theories formulated. The very few models of second language acquisition available focused on the development of an L2 once the L1 has already been acquired. All of them acknowledge a fundamental difference between L1 acquisition and L2 learning. This difference is rooted in the differences between the incidental or implicit learning of L1 and the explicit acquisition of L2.

The *extended competition model* (MacWhinney, 2007) consists of seven components: competition, arenas, cues, storage, chunking, codes, and resonance. The competition component is situated at the core of the model and is responsible for selection which is executed

depending on the relative strength of the target material. Arenas represent the four psycholinguistic processes (phonology, lexicon, morphosyntax, and conceptualization) at the comprehension and production level. Cues refer to the mappings between the form and function. Storage represents the short-term and long-term memory systems in which the acquired mappings are stored. Chunking refers to the relative size of particular mappings. Codes are responsible for transfer and code interactions that in turn refer to code selection, switching, and mixing. Resonance is directly related to learning processes and it refers to the influence and interaction between levels. One example is the resonant connections between inner speech and action, such as thinking “I am thirsty” and consequently drinking a glass of water.

The extended competition model has successfully explained, among other verbal behaviors, age-related constraints in L2 acquisition. In line with recent studies challenging the reality of these age constraints in L2 learning (Hakuta, Bialystok, & Wiley, 2003; Wiley, Bialystok, & Hakuta, 2005) the model suggests that the learning difficulties arise from the entrenched nature of L1 rather than age and makes useful predictions on how these difficulties might be overcome through effective teaching (MacWhinney, 2007).

The *revised hierarchical model* (Kroll & Stewart, 1994) emerged to account for the developmental changes that occur as the proficiency of the second language learner increases. At the early stages of second language learning L2 words are directly associated to their translation equivalents and meaning is accessed indirectly through the already created links between L1 word forms and meaning. L1 and L2 associations create a lexical pathway or link between the L2 and L1 word representations. This link is bidirectional, but as a result of the manner in which L2 is learned (L1 translation equivalents are often provided in order to understand L2 words and only occasionally the other way around), the link is stronger from the L2 to L1 lexical representations than from the L1 to the L2 lexical representations. As proficiency increases direct connections between the L2 words and their meanings are established and strengthened with time and L2 use. However, the conceptual links with L1 words remain stronger.

The revised hierarchical model is focused on L2 vocabulary development by individuals with a well-established knowledge of their L1. By contrast, the extended competition model described above, is a model concerned with all aspects and forms of language learning in L1 and L2 (i.e., lexical, phonological, and morphosyntactic learning in L1 and L2 by children and adults).

The *psycholinguistic model of vocabulary acquisition* (Jiang, 2000) divides the vocabulary acquisition in L2 in three stages: formal stage of lexical development, lemma mediation stage, and second language integration stage. At the formal stage of lexical development only the formal characteristics (spelling and pronunciation) are learned and therefore represented in memory. This is because the meaning of words is provided by the first language through translations or definitions rather than extracted from the context. Using L2 words at this stage requires the activation of the links between the L2 words and their L1 translation equivalents. The lemma mediation stage occurs after prolonged experience with the L2. Here the semantic and syntactic information of the L1 word is borrowed by the L2 word. The representation of L2 words at this stage involves the form of the L2 word and the meaning and syntax associated to its L1 translation equivalent. It is argued that despite the use of the meanings originally linked to the L1 words, the L1 lexical forms do not play a critical role in the L2 word use at this stage. The second language integration stage occurs when L2 lexical competence is fully developed. This is when meaning, syntax, morphology, and L2 form are used in an integrated manner. Here the representation and processing of the L2 word is similar to the L1 word.

The psycholinguistic model of vocabulary acquisition as the revised hierarchical model also explains L2 vocabulary development once the L1 lexicon has been established. However,

while the psycholinguistic model of vocabulary acquisition attends to the representation of the L2 words, the revised hierarchical model emphasizes the cognitive processes and changes underlying learning. The revised hierarchical model has also been one of the more inspiring models in bilingual research over the last 15 years generating over 200 studies testing hypotheses motivated by the model (Brysbaert, Verreyt, & Duyck, 2010; Kroll, van Hell, Tokowicz, & Green, 2010).

Conclusions

Three major determinants of bilingual vocabulary acquisition have been addressed in this review: the influence of age in the acquisition of foreign words, the effectiveness of different methods of instruction, and how the characteristics of the words to-be-learned have been used to select the vocabularies for instruction programs and how some characteristics might facilitate learning. However, some issues related to L2 word learning have been inevitably left out. Amongst them is the relative difficulty of learning a second language that does not have close proximity to the first language (e.g., German and English languages are closer and are therefore easier to learn as L1 and L2 than English and Japanese). A study carried out by the Foreign Service Institute of the US Department of State reported that out of the 63 languages analyzed the five languages more difficult to learn by English native speakers were Arabic, Cantonese, Mandarin, Japanese, and Korean (Jackson & Kaplan, 2001). This and other issues such as similarities and differences between learning written or auditory presented words and the rate of vocabulary acquisition in relation to second language proficiency also deserve further attention.

Vocabulary Acquisition in Second Language Acquisition

PAUL NATION

A well-balanced vocabulary course provides opportunities for acquisition through meaning-focused input, meaning-focused output, language-focused learning, and fluency development. Three of these learning strands are communicative in that they involve learners focusing on the comprehension and production of messages. The strand of language-focused learning, as its name suggests, involves deliberately focusing on language features such as sounds, spelling rules, vocabulary, multiword units, grammar, and discourse. The language-focused learning strand also involves training learners in the use of learning and coping strategies (Nation, 2007). This review focuses on deliberate and analytical approaches to vocabulary learning.

In vocabulary studies, there is a very long history of deliberately focusing on vocabulary with the finding that the deliberate study of vocabulary is a very effective and efficient way of rapidly increasing a learner's vocabulary size (Thorndike, 1908; Webb, 1962; Crothers & Suppes, 1967; Griffin & Harley, 1996). A substantial proportion of this research was carried out in psychology departments and its main focus was on the investigation of learning and memory rather than second or foreign-language vocabulary development.

Such deliberate and largely decontextualized learning has been criticized for not resulting in the kind of knowledge that is needed for normal language use, namely implicit knowledge. Implicit knowledge is characterized by being subconscious, fluently available, and well integrated with the learner's lexical system. Recent research (Elgort, 2007, 2011), however, has shown that deliberate vocabulary learning directly results in both implicit and explicit knowledge. This research does not deny the value of message-focused incidental learning. Such learning is also likely to result in implicit knowledge and can help develop fluency of access to deliberately learned items as well as enrich knowledge of them. Let us look briefly at the very important set of studies by Elgort, before examining vocabulary-learning strategies in more detail.

Elgort conducted three different kinds of priming tasks involving meaning priming and form priming. Here is an example of one such task. A learner is sitting in front of a computer screen. A word briefly flashes up on the screen (this is the prime) and this is followed by another word (this is the test word) that stays there until the learner decides whether the test word is a real word or not. The learner indicates this by pushing one key if it is a real word or a different key if it is not.

If the prime word is related to the test word, for example *milk* priming the test word *cow*, the learner will respond more quickly than if the test word, for example *ladder*, is not related to the prime *milk*. The prime words appear for only a fraction of a second, and in one of the studies, four fifths of the learners when questioned later did not realize that they had been primed. Nevertheless, they consistently responded faster to test words related to the primes than to test words not related to the primes and to nonsense words.

The words which were used as primes in the three studies were deliberately learned words that had been studied using word cards in the week preceding the experiment. These were specially created words that followed the spelling patterns of English, but which represented previously unfamiliar concepts, such as "a shallow tub used for mixing small amounts of concrete or for washing tools on a building site." As these were words

2 VOCABULARY ACQUISITION IN SECOND LANGUAGE ACQUISITION

and meanings specially created for the experiments, learners could not have had any previous knowledge of them. The fact that these deliberately learned words successfully functioned as primes showed that they were subconsciously and fluently available (there was not enough time to retrieve them deliberately and many of the learners did not consciously know that they had briefly appeared as primes), and that they had been well integrated into the existing lexical system because they successfully primed related words.

The findings of this research are important because they show that, unlike grammar, deliberately learned vocabulary can directly enter implicit knowledge. Thus the deliberate learning of vocabulary directly results in the kind of knowledge needed for normal language use. Presumably, this finding will also apply to multiword units learned as vocabulary items (Steinel, Hulstijn, & Steinel, 2007).

The strategy of learning words using word cards is well supported by other research as well. The findings of such research provide the following guidelines for the strategy.

The Word-Card Strategy

Learning words from cards involves writing a word on one side of a small card (about 4 cm × 2.5 cm) and writing its first language translation on the other side. Learners usually keep the cards in packs held together by rubber bands and, when they have a few free moments, go through the cards and try to recall the meanings. Here is an example of a word card for an Indonesian student:

Front (the word to learn)

Back (the L1 translation)

Although learning using word cards is very effective, word cards should only be seen as one of the first steps in learning a word. There are several reasons for this:

- There is more to knowing a word than knowing its translation.
- Learning a word is usually a cumulative process, not a one-off piece of learning.
- Learners should not only know words: the words also have to be readily available for use.

However, learning to recognize the form of a word and its translation is a very good step toward knowing that word. Research on vocabulary learning provides useful indications of how to learn from vocabulary cards most effectively (Nation, 2001, pp. 296–316).

1. Write the word on one side of the card and its translation on the other side. This forces retrieval of the item after the first meeting. Each retrieval strengthens the connection between the form of the word and its meaning (Baddeley, 1990). Seeing both forms together does not have this effect. Writing words in a notebook takes away the opportunity for retrieval because both the word form and the meaning can be seen together.
2. Initially start with small packs of cards, about 15 or 20 words. Learn difficult items in small groups to allow more repetition and more thoughtful processing. As the learning gets easier, increase the size of the pack (Crothers & Suppes, 1967). Anything more than 50 usually tends to be unmanageable.
3. Space the repetitions. The best spacing is to go through the cards a few minutes after first looking at them, and then an hour or so later, and then the next day, and then a week later, and then a couple of weeks later (Pimsleur, 1967). This spacing is much more effective than massing the repetitions together into an hour of study. The total time taken may be the same but the result is different. Spaced repetition results in longer-lasting learning.
4. For words that are difficult to learn, use depth of processing techniques like the key-word technique (Pressley, 1977). Think of the word in language contexts and situational contexts. Break the word into word parts if possible. A simple picture can also be very helpful. The more associations you can make with an item, the better it will be remembered.
5. Make sure that words of similar spelling or of related meaning are not together in the same pack of cards. This means days of the week should not all be learned at the same time. The same applies to months of the year, numbers, opposites, words with similar meanings, and words with the same superordinate such as items of clothing, names of fruit, parts of the body, and objects in the kitchen. These items interfere with each other and make learning much more difficult (Higa, 1963; Tinkham, 1997; Waring 1997).
6. Keep changing the order of the words in the pack. This will avoid serial learning where the meaning of one word reminds you of the meaning of the next word in the pack.
7. Say the word aloud to yourself. This helps the word form to enter long-term memory.
8. Write collocates of the words on the card too where this is helpful. This particularly applies to verbs. It is better to learn some words as part of a phrase.

As mentioned above, the key-word technique has proven to be a very useful way of helping words to stay in memory (Ellis & Beaton, 1993). Numerous experiments have shown that this technique increases the efficiency of vocabulary learning by around 25%. Except in a few predictable cases, the technique has no negative effects on the pronunciation or spelling of words learned by this technique.

There are four parts to the technique:

1	2	3	4
The foreign word	First language key word which sounds like the foreign word	Mental image of the meaning of the key word and foreign word	Meaning of the foreign word

4 VOCABULARY ACQUISITION IN SECOND LANGUAGE ACQUISITION

Step 2 provides the link to the form of the word and Step 3 provides the meaning link.

Let us look at an example. Here, the four parts have numbers to match the four parts of the technique. When learning that the meaning of (1) *succumb* is (4) to give in, an Indonesian learner of English might use (2) the key word *suka* which means “to like,” because this sounds like *succumb*. The (3) image could be someone being happy at having to give in to temptation.

1	2	3	4
succumb	suka	being happy at having to give in to temptation	to give in

The key-word technique works because it makes learners process more than one feature of a word and this processing is not superficial in the way that rote repetition is superficial. The only limit is the learner’s imagination.

The key word does not have to sound exactly like the foreign word, and it does not have to be like all of the word. If the form of the key word is like the beginning of the foreign word, then that is usually enough. Initially, learners need to practice thinking of key words for many different foreign words under the guidance of the teacher. Explaining the technique to learners is not enough. The technique need not be used with every word, only those that prove difficult to remember.

Learning from word cards is one step on the way to learning a word, but it is not sufficient on its own. Learners also need to meet vocabulary in meaning-focused input, meaning-focused output, and fluency-development activities.

Learning Using Word Parts

About 60% of English words come from French, Latin, or Greek (Roberts, 1965), and many English words have prefixes, stems, and suffixes that may also occur in other words. Becoming familiar with the meanings and forms of common word parts can help learners remember words. This strategy is useful when learners come across a new word that contains parts they already know. First the learner needs to find the meaning of the word, by guessing from context, by consulting a dictionary, or by asking somebody. The learner then looks at the word to see if it contains parts which are familiar. If it does, then the third step is to relate the meaning of the known parts to the meaning of the word.

To use the word-part strategy, the learner needs to know the forms and meanings of the most common word parts which may be helpful for remembering the meanings of words (Stauffer, 1942). Surprisingly, the most useful parts tend to be prefixes. Word stems, for example the *cess* in *process*, are often not very helpful. Prefixes seem to have retained their meaning much better than stems have.

Here are some examples:

Exceptional: The prefix *ex* means out or away. Something exceptional is out or away from the usual.

Retain: The prefix *re* means back or again, and *tain* means to hold. When we retain something we hold it back. Note that *tain* occurs in other words, such as *attain*, *sustain*, *contain*.

Comprehensive: The prefix *com* means together. When something is comprehensive, it brings together all of the things involved.

These explanations may seem a little awkward, but relating unknown items to known items leads to deeper processing, which in turn makes learning more secure.

Learning From Dictionaries

In many ways dictionary use supports the other strategies we have looked at. It provides meanings for the word-card strategy, and it provides meanings for word-part analysis. In addition, dictionary use can also be a strategy in itself to help vocabulary learning.

There are three kinds of dictionaries that a second or foreign-language learner may use. The word definitions in monolingual dictionaries are all in the second language. The problem with monolingual dictionaries is that learners need a vocabulary of at least 2,000 words to be able to understand the definitions. However, they contain a large amount of very useful information about the meaning and use of words.

Bilingual dictionaries use the learners' first language to give the meanings of the words. This makes definitions easy to understand and thus bilingual dictionaries are very popular among learners who are in the early stages of language learning. Surprisingly, high-proficiency learners keep using bilingual dictionaries even though they could manage monolingual dictionaries. Bilingual dictionaries differ a lot in quality but they are a very important learning tool.

A less common but very useful dictionary is the bilingualized dictionary. Usually this is a monolingual dictionary that has the first language meanings of the words added to it. It combines the best features of bilingual dictionaries with those of monolingual dictionaries. Learners generally do better with bilingualized dictionaries because they allow learners easy access to the meaning as well as a lot of useful supporting information (Laufer & Hadar, 1997).

Research on dictionary use indicates that learners tend not to make the best use of the wide range of information available. Learners' dictionaries can become learning dictionaries if they are used strategically.

1. Before looking up an unknown word, try to guess what the word might mean from the context clues. This will help when having to choose a particular sense listed in the dictionary.
2. When looking up the meaning of a word, look at all the senses in the entry and see if there is a common underlying meaning running through the different senses. For example, *interpret* can mean (a) to explain the meaning of a difficult text, (b) to understand the purpose of something such as a gesture, (c) to translate from one language to another, (d) to convey the spirit of a work of art as in interpreting a dance. All of these share the sense of carrying the meaning of something from one form to another. Seeing this underlying meaning then makes the range of uses of the word accessible to the learner.
3. When you have found the right meaning, look at the example sentences containing the word in the dictionary and try to visualize the meaning of these sentences. Also think of a situation when you might use these sentences.
4. If you are using your own dictionary, use a pencil to put a small mark next to the word to show that you have looked it up. If you find that you look up the same word again, it is clearly a good idea to put this word on a word card and deliberately learn it.
5. Some dictionaries have frequency markers next to the most useful words. The *Longman Dictionary of Contemporary English* uses letters and numbers; S1 means the word is in the first 1,000 words of spoken English, while W3 means it is in the third 1,000 words of written English. The *COBUILD* dictionary uses diamonds; the more black diamonds

there are, the more frequent and useful the word is. Markers like these provide a very useful guide to the value of spending time deliberately learning a particular word. Teachers should help learners to become skillful at interpreting these markers and acting on the information they give.

Learners' dictionaries would be greatly improved as learning resources if they included word-part information that could be used for mnemonic purposes, and if they explicitly described the core meanings of words. Research by Boers and his colleagues (see for example Boers, Eyckmans, & Stengers, 2007) has shown the value of giving attention to the etymology of multiword units and learners' dictionaries could easily include references to this.

Evaluating Activities for Deliberately Learning Vocabulary

Analyzing teaching techniques is a very important area of research because its goal is to work out which techniques best help learning and which features of techniques best help learning. Because there is a reasonably large number of vocabulary-teaching techniques and activities, there is a real choice between which ones to use. Which ones are likely to work well? Why are they likely to work well? Can the features which make them work well be used in other techniques to improve them? Technique analysis thus has very useful practical goals, and finding effective systems of technique analysis can help improve teaching and learning.

The best-known and best-researched way of analyzing vocabulary teaching techniques is Laufer and Hulstijn's (2001) involvement-load hypothesis. Involvement load involves three factors: need, search, and evaluation. Each of these factors may be absent (0), present with moderate strength (1), or present with full strength (2).

Need considers if the unknown word is needed to complete the task. Search considers whether the learner has to search for or retrieve the meaning or form of a particular word. Evaluation examines whether the task involves having to compare the form or meaning with other possible words or meanings in order to choose the most suitable one for the context. The sum of the strengths of these three factors represents the involvement load of the task. The greater the involvement load, the better the learning.

The involvement-load hypothesis has been directly tested in at least four published experiments (Hulstijn & Laufer, 2001; Folse, 2006; Keating, 2008; Kim, 2008), and in one less explicitly (Webb, 2008). These studies have provided support for the testability of the hypothesis, though not always support for the hypothesis, and they have shown that other factors like time on task and repetition need to be considered. This analytical approach to investigating vocabulary-learning activities has a lot of potential and provides a useful starting point for experimental and observational research. Not only does it lead to a deeper understanding of how teaching activities work, it also allows for the adaptation and improvement of such activities.

Deliberate and analytical approaches to vocabulary learning speed up vocabulary learning, strengthen knowledge, and also provide the kind of knowledge that is needed for normal language use. It is important that such approaches are balanced by more communicative and fluency-focused activities so that deliberate learning is not the only or major means of learning. Although deliberate vocabulary learning is a highly effective way of increasing vocabulary size, it is only one of a range of complementary ways of developing proficiency.

Vocabulary and Language for Specific Purposes

AVERIL COXHEAD

Language for specific purposes (LSP) can be defined as “the teaching and research of language in relation to the communicative needs of speakers of a second language in facing a particular workplace, academic, or professional context” (Basturkmen & Elder, 2004, p. 672). Vocabulary is a core topic in this research for many researchers (Robinson, 1991; Harding, 2007) and is important because learners need to “express concepts in their fields” (Basturkmen, 2006, p. 69). Ongoing research into vocabulary and LSP sheds light on lexis in both speaking and writing in a range of specialized contexts. This entry explores several key concepts in this research and looks at some examples from curriculum design.

Investigating Vocabulary and Language for Specific Purposes

It is important for teachers and learners to find out what vocabulary is encountered in different contexts, what company it keeps, and what might be the most efficient way of teaching and learning it. A key point related to specific purpose is technicality of vocabulary because it tends to “correlate with narrow distribution” (Ward, 2009, p. 674). Needs analyses are often a first step for LSP teachers as a way to narrow the possibilities of deciding the classroom focus. Unfortunately, not all teachers have ready access to corpora such as the Corpus of Professional English (www.perc21.org/corpus_project/index.html) with its 17 million words of academic journal articles divided into 22 fields, including agriculture, computer science, engineering, food science, medicine, and telecommunications. Another problem for teachers is the number of terms used to describe specialized vocabulary, including “specialized,” “technical,” and “semi-technical.” Mudraya (2006, p. 242), for example, defines lexical items that have both nontechnical and technical senses as “sub-technical” vocabulary.

Scholars such as Hyland (2002) stress the need for specificity in ESP (English for specific purposes). Basturkmen and Elder (2004) state that there is complexity resulting from variations between different groups in ESP. An ESP teacher might face developing a course on aviation for Turkish learners (Sullivan & Girginer, 2002) or teaching a class of Thai civil engineering students (Kaewpet, 2009). Each situation brings its own set of unique variables, including the specialized vocabulary of a particular field, the learners’ first language(s), proficiency in the second language, time available for studies, and goals of the learners. Kaewpet (2009), for example, analyzes the communicative needs of Thai civil engineering students by gathering data from a wide range of stakeholders. This researcher finds that students need to be able to talk about everyday tasks, read textbooks, read technical manuals, and write reports, and concludes that these needs are driven by occupational rather than educational reasons. This study finds that professional Thai conversations are likely to include technical terms in English when they are taking place in Thai. This finding suggests that students need to learn to recognize and use technical engineering terms in spoken language and not just written, even when working in their first language context.

Read (2007, p. 116) states that when it comes to studying specialized vocabulary, “We have lacked systematic procedures for identifying technical words in particular texts.” However, some research by Chung and Nation (2003, 2004) has begun to address this lack. In a study of the technical vocabulary occurring in specialized texts, Chung and Nation (2003) used a four-step scale to rate the words in two textbooks, one from applied linguistics and the other from anatomy. The scale begins at Step 1 with words with a meaning with no particular connection to the subject area, such as *between*, *amounts*, and *early*. Step 2 comprises words related to the subject area but only minimally, such as *supports*, *part*, and *protects* (in the case of anatomy). Step 3 comprises words closely connected to anatomy, such as *neck*, *heart*, and *breathing*. Step 4 contains words specific to anatomy and not generally known, such as *fascia* and *pedicle* (p. 105). Steps 3 and 4 are defined as the technical vocabulary.

This new definition of technical vocabulary resulted in categorizing one word in three in an anatomy text as technical in nature, compared to one in five in an applied linguistics text. The authors partially attribute this result to the higher degree of accessibility of applied linguistics. This finding is startling in two ways. First, previous estimates of technical vocabulary in texts placed the number much lower than 33%. Second, the study showed that the amount of technical vocabulary varied in different subject areas, meaning that specialists in one field might face a far bigger learning task than specialists in another field. In another study, Chung and Nation (2004) describe, compare, and evaluate three other ways of identifying technical vocabulary in texts. These methods are making decisions based on lexical items in a technical dictionary, looking at clues about the words in a text (such as definitions of technical terms), and using computer-based corpora.

Specialized vocabulary can include everyday words as well as highly specialized words. To use an example from Basturkmen (2006, pp. 63–4),

We may find that in general usage the word “present” is very often used as a transitive verb – for example, “We presented the results” – and that this verb is rarely followed by the preposition “with.” However, if we established a corpus of texts written or spoken by medical practitioners, we might find that “present” is often followed by “with” – for example, “She presented with severe weight loss” and “The patient presented with pain in the upper right molar.” From this we might conclude that “present with” occurs regularly in medical texts and that it carries a specific meaning in this discipline. Doctors report this meaning as roughly synonymous with the phrase “having symptoms.”

Sutarsyah, Nation, and Kennedy (1994) looked at the lexis of an economics textbook and found that a group of 34 words including *cost*, *supply*, and *average* occurred on average once every 10 words in the text. Approximately 20 of these words were clearly essential to the specialist discipline of economics but also occurred in the first 1,000 words of West’s (1953) *General Service List of English words* (GSL), a well-known and widely used list. These 20 words occurred with higher frequency in the economics text than in a general academic corpus. Mudraya (2006) finds that words such as *solution* occur more frequently in their nontechnical than technical sense in a written engineering corpus. Pinna (2007) looks at single words, two-word clusters, and three-word clusters in dentistry and finds examples of key words such as *bone* linked to other words like *graft* and *cortical*. Such information can aid fluency and help second language speakers sound as though they belong to a community of language users who make meaning through using the same vocabulary in specific ways.

These studies and other recent corpus-based research endeavors are all essentially looking for an answer to the same question: At what point is it better for learners with special purposes to start focusing on learning the specialized vocabulary of their chosen field?

Basturkmen (2006) outlines two fundamental perspectives on the point of language for specific purposes. One is that “all language is specific purpose” (Basturkmen, 2006, p. 17). That is, “All English exists as some variety or another” (p. 18). Exponents of this perspective argue that specialization from early stages benefits the language learner and can start early on. One example is Ward’s (2009, p. 172) English word list of basic engineering for lower-proficiency undergraduates. In another study, Ward (1999) examined engineering texts in order to determine the number of words students in this subject would need to know. His research suggested the case for early specialization and resulted in a targeted word list of 2,000 word families that returned 95% coverage of his engineering corpus.

The other perspective on language for specific purposes (Basturkmen, 2006) is that there is a “common core” language or a “general pool of language of high-frequency items that predominates all uses of language” (p. 16). Support for this point of view comes from corpus-based studies that illustrate the coverage of general service vocabulary over a range of texts (Nation, 2006). The Academic Word List (AWL) (Coxhead, 2000) looked beyond West’s (1953) first 2,000 words in the GSL for lexical items that occurred across 28 academic subject areas in four disciplines. Various studies have examined the coverage of the AWL in different specialized corpora, such as medical research articles (Chen & Ge, 2007), agricultural science articles (Martínez, Beck, & Panza, 2009), and business English (Konstantakis, 2007). Coxhead and Hirsh (2007) developed a pilot science-specific word list using the GSL and AWL as baseline word lists.

Teaching Vocabulary and Language for Specific Purposes

Teachers need to be aware of the purposes and methods of any corpus study into LSP before bringing the research findings into the classroom (Harding, 2007). For example, the AWL (Coxhead, 2000) was developed from a written corpus of academic texts and the list was intended for use by EAP (English for academic purposes) teachers and students preparing for university study. Harding (2007, p. 53) also points out that vocabulary learning in specialized contexts is not just focused on technical words. He writes, “As well as building and practicing technical and semi-technical lexis, vocabulary teaching in LSP will involve a number of sub-skills: deducing meaning from context, word-building, understanding appropriate register and genre (including formal vs. informal, receptive vs. productive use).”

Harding (2007) provides a range of vocabulary learning activities for LSP, including *personal learning dictionaries* (pp. 54–5) whereby learners compile paper- or computer-based records of target words of their special field. Harding describes various approaches to compiling and using dictionaries for learning. This activity builds on concepts such as different aspects of word knowledge for all four skills, research into the effectiveness of word cards for fast learning (see Nation, 2001), and recognition that LSP learners are likely to be independent adults with their own priorities and principles for learning.

If teachers and learners do have ready access to computers and the Internet, they can conduct their own studies into the nature of the specialized vocabulary. Using Tom Cobb’s Compleat Lexical Tutor (Cobb, *n.d.*), for example, students can search and compare the use of target words in several specialized corpora. Harding (2007, pp. 67–71) includes corpus-based investigations by learners, whereby learners follow relatively detailed instructions on conducting their own research using targeted corpora on line. Popescu (2007) looks at teaching business collocations through concordancing and has students building their own specialized dictionaries. Greaves and Warren (2007) use Concgram, a program which highlights “all of the associated words of a concgram in each concordance line” (p. 290). The following example sentence shows collocates close together, “Strong government is a prerequisite for *economic development*,” while the next example sentence shows collocates

within several words of each other, “to study political, *economic* and social *development*” (2007, p. 299). These examples show how technical words can co-occur with more everyday words, and that learners and teachers need to also look beyond near collocates to see patterns in the specialized vocabulary in texts.

More examples of specialized vocabulary in online teaching and learning are appearing. Chujo, Oghigian, Nishigaki, Utiyama, and Nakamura (2007) describe the development of e-learning materials for Japanese students of business English using target words from an intermediate level business word list. Each unit contains target words that are presented and practiced in both meaning- and form-based tasks. A wide variety of activities are rapidly becoming available online through publishers and other sources, often as companion Web pages for books. Two readily found examples come from Cambridge University Press and Longman Pearson. Cambridge University Press’s Web sites on professional English provide learning activities on topics such as international legal English. Students might match words and definitions, or teachers could use ready-made materials that focus on current terminology such as *corporate social responsibility* or *hedge funds* (www.cambridge.org). Pearson Longman provides materials on topics such as intelligent business. These units contain reading-based, vocabulary-focused tasks such as matching words and phrases with in-text meanings. The intelligent business example includes target words such as *pundit*, *the lion’s share*, and *all things being equal* (www.intelligent-business.org).

LSP dictionaries are an important resource for teachers and learners. They are primarily designed for a variety of specialized audiences and are both online and paper-based. Some focus on the language of a particular academic discipline, such as linguistics, while others support an area of professional expertise, such as law. They are useful for interpreting in specialized contexts. It is vital to know how specialized dictionaries are compiled. Chung and Nation (2004) point out that it can be difficult to compare the results of one study using a technical dictionary with the results from using a different dictionary in the same field. Also, learners need to know which dictionary will best suit their needs.

In conclusion, vocabulary for specific purposes is an important and wide-ranging area of research and teaching. Some studies have looked into the nature of specialized vocabulary itself and used a variety of ways to locate these words. Other studies have focused on one particular discipline or area of professional endeavor. All of these studies argue that specialized vocabulary is important, none more cogently than Woodward-Kron (2008), who, in a longitudinal study of undergraduate students’ academic writing in education, argues,

The specialist language of a discipline is intrinsic to students’ learning of disciplinary knowledge; students need to show their understanding of concepts, phenomena, relations between phenomena etc. by incorporating the specialist language and terminology of their discipline into their writing accurately. They also need to adopt the specialist language in order to make meaning and engage with disciplinary knowledge. (p. 246)

In a field where learner needs are so clearly driven by specific professional and academic contexts, many more questions on the nature of specialized vocabulary still remain.

Vocabulary and Reading

ANA PELLICER-SÁNCHEZ

Vocabulary and reading are characterized by a reciprocal and mutually supportive relationship. A common way of looking at this relationship has been to focus on the dual direction of its effect (Hu & Nation, 2000). On the one hand, vocabulary is one of the necessary elements for successful reading comprehension, and, on the other hand, reading contributes to vocabulary acquisition and growth. Vocabulary development should therefore be viewed as both a cause and a consequence of reading abilities (Stoller & Grabe, 1993). The two directions of this reciprocal relationship will now be discussed in turn.

Vocabulary for Reading

Looking at one of the directions of this relationship, vocabulary has been understood as one of the main predictors of reading success. “No text comprehension is possible, either in one’s native language or in a foreign language, without understanding the text’s vocabulary” (Laufer, 1997, p. 20). There are numerous research studies showing this strong relation between different measures of vocabulary and reading comprehension, both in the first language (L1) (Anderson & Freebody, 1981) and in the second language (L2) context (Laufer, 1991).

One of the most important issues in the examination of the role of vocabulary knowledge for reading is that of the amount of vocabulary needed for successful reading. Achieving successful comprehension will obviously depend on the purpose for reading, namely, whether reading for gist, reading for specific details, and so forth. In the L1 context we may assume that readers would already have the required vocabulary size, as long as the reading is grade-appropriate. However, since we cannot make such an assumption for L2 readers, the issue of vocabulary size for reading acquires particular importance in the L2 context. How many words, then, are needed for L2 reading? The answer to this question rests on two main points: first, the percentage of words in a given text that we need to know in order to achieve full, successful comprehension (“lexical coverage”); and, second, the vocabulary size—that is, the number of word families—we need to know for achieving such lexical coverage.

It was initially suggested that for achieving successful reading comprehension, students need to know around 95% of the words in a text (Laufer, 1989). A lexical coverage of 95% means that there would be one unknown word in every 20 running words in a text. This basic coverage figure was generalized to a range of learners and learning conditions and persisted for over a decade. However, more recent studies suggest that 95% coverage is not enough to ensure successful comprehension and that 98% is a better and more realistic figure for the lexical coverage required to understand a text (Hu & Nation, 2000). With 98% coverage, it will be easier for a reader not only to obtain a better understanding of the text, but also to guess any unfamiliar words. Nevertheless, other even more recent studies show that there is no clear threshold, but a linear progression with larger coverages leading to better comprehension (Schmitt, Jiang, & Grabe, 2011). Thus there is no one, unique percentage that is required for successful reading comprehension, but it appears to be somewhere between 95% and 98% coverage.

2 VOCABULARY AND READING

This leads to the second key question: how many words do we need to reach high lexical coverage in texts? There have been many different attempts to determine the amount of vocabulary needed for successful reading comprehension, and all results seem to point toward the same conclusion: learners need to know a large number of word families (groups of words which share the same root and are semantically related, e.g., *vision*, *visualize*, *visual*, *visually*, *visualization*, etc.) in order to be able to independently read authentic texts in English without vocabulary impeding comprehension.

Based on the 95% coverage figure discussed above, Laufer (1989) calculated that learners need around 3,000 word families to begin to read authentic materials, generally texts written for L1 adult readers and not particularly designed for L2 learners, while 5,000 word families are necessary to read them independently. However, later studies showed that these figures were not sufficient to provide the preferred 98% coverage and that, therefore, for reaching such coverage a larger number of words is required. Nation (2006), for example, explored a variety of written texts and examined the vocabulary size requirements needed for reaching the 98% coverage in those texts and found that this lexical coverage was achieved by knowing 8,000–9,000 word families.

Despite the need and usefulness of these estimates of vocabulary size for successful reading, it is important to consider some of the limitations of such figures. Most research on vocabulary size estimates has been done with English but, due to its unusually large and complex vocabulary, it is important to be cautious when generalizing vocabulary size estimates to other languages, which might require smaller vocabulary sizes (Nation & Meara, 2002).

It is also important to note that vocabulary per se does not guarantee successful reading comprehension. Various factors exert an important influence in the reading comprehension process. Background or prior knowledge, for example, has been shown to be crucial in facilitating good reading comprehension (Bernhardt, 1991). The use of general reading strategies (e.g., guessing unknown words, inferencing, recognizing the type of text and text structure, and grasping the main idea of the paragraph) has also been highlighted as a key factor leading to successful reading comprehension (Laufer, 1997).

Reading for Vocabulary

Looking at the converse direction of the vocabulary–reading relationship, reading is an effective means for vocabulary growth, both in L1 and L2 environments. Although words are also learned from spoken discourse, learning from written discourse has been much more highly researched and has been shown to be a major source for new vocabulary learning.

L1 Vocabulary Acquisition From Reading

The role of reading for vocabulary acquisition has been particularly widely explored in L1 contexts. L1 children initially learn vocabulary from mainly verbal exposure (Ingram, 1989), but once they begin to read, learning incidentally from reading appears to account for most L1 vocabulary acquisition (Nation & Meara, 2002).

Numerous studies have provided empirical evidence to support the idea that new vocabulary can be learned incidentally from different reading tasks and that it constitutes a substantial proportion of children's vocabulary growth (Freebody & Anderson, 1983; Nagy, Herman, & Anderson, 1985; Stanovich, 1986). In one of the best illustrations of L1 incidental vocabulary acquisition, Saragi, Nation, and Meister (1978) showed that their English-speaking participants had learned a substantial number of the 90 Russian slang words (called "nadsat") which appeared in the book they had read (*A Clockwork Orange*,

by Burgess, 1972), demonstrating that considerable incidental vocabulary learning occurred from reading authentic materials.

L2 Vocabulary Acquisition From Reading

Although the majority of research studies show substantial amounts of vocabulary acquisition from reading in an L1 context, we cannot assume a similar state of affairs in an L2 learning environment. The clear and substantial differences between L1 and L2 reading processes make it impossible to directly transfer L1 reading research results to L2 contexts. These differences include linguistic and processing differences (e.g., different levels of language proficiency), individual and experiential differences (e.g., the age of learners), and sociocultural and institutional differences (see Carrell & Grabe, 2002 and Grabe & Stoller, 2002 for a more detailed discussion of L1 and L2 reading differences).

What is really referred to when discussing vocabulary acquisition and lexical gains from reading? The majority of studies in the area have traditionally focused on students' acquisition of new words' meaning, typically using multiple-choice or translation tasks (Pitts, White, & Krashen, 1989; Waring & Takaki, 2003; Brown, Waring, & Donkaewbua, 2008), and although still showing worthwhile incidental acquisition of new L2 words from reading, most suggest that the number of words learned is relatively modest.

However, it is important to consider that there is much more to know about a word than this form–meaning link, namely, grammatical information, spelling, written form, spoken form, associations, collocations, and so forth. Fortunately, researchers have started to call attention to this idea of the different components of vocabulary knowledge and, consequently, a number of more recent studies have looked at the acquisition of various lexical aspects from reading, including spelling ability (Day & Swan, 1998); spelling, meaning, and grammatical characteristics (Pigada & Schmitt, 2006); spelling recognition, recall of grammatical class, meaning recall, and meaning recognition (Pellicer-Sánchez & Schmitt, 2010); and orthography, association, syntax, grammatical functions, and form meaning (Webb, 2007). These multi-aspect studies have indicated that reading can enhance a variety of word knowledge aspects and have demonstrated that vocabulary acquisition from reading is more diverse than the previous meaning-only studies indicated. This supports the idea that although the uptake of *new* words from reading is generally low, an important benefit of reading is the *consolidation, enhancement, and strengthening* of the partially known vocabulary. Reading is therefore still considered “the primary way that L2 students can learn on their own beyond the classroom” (Carrell & Grabe, 2002, p. 233).

Moreover, when dealing with this idea of the multiple dimensions of vocabulary knowledge, it is worth considering that L2 reading does not equally affect all the different aspects of vocabulary knowledge. Research seems to suggest that incidental vocabulary acquisition from reading has a larger effect on the ability to recognize words' meanings than recalling them, and that recognition knowledge seems to have better retention over time (Waring & Takaki, 2003).

The beneficial role of reading for incidental vocabulary acquisition can always be further increased by any type of more specific, focused, explicit exposure. The combination of both approaches—reading plus explicit follow-up activities such as comprehension questions or matching definitions with words in the text—has in general produced better gains and has nearly always proved to be more effective for vocabulary learning, as compared to reading on its own (Paribakht & Wesche, 1997).

Facilitative Factors for Successful Vocabulary Acquisition From Reading

The relationship between reading and vocabulary acquisition is not straightforward and a number of conditions and factors will affect its efficiency. For example, the linguistic

4 VOCABULARY AND READING

properties of the words themselves (e.g., their frequency, saliency, or cognate status) play a crucial role in their potential learning. The more frequent the word in the language, the more salient, or the closer to the L1, the more chances of learning it.

Another condition affecting the opportunity to learn words from context is the frequency of repetition in the text. A single exposure to an unknown word while reading does not guarantee its subsequent acquisition. Saragi et al. (1978) explored this factor and found that the minimum number of repetitions needed for learning a word from context was somewhere around 10. Later research studies seem to confirm that new words need to be met around 8 to 10 times for considerable learning to occur. Providing several repetitions of words and ensuring enough opportunities for recycling are key conditions for successful vocabulary acquisition from reading and its subsequent retention.

Just as was the case for achieving successful reading comprehension, in order to acquire new vocabulary from reading a high percentage of the words in the text must be known by the reader (Nation & Meara, 2002). However, at the same time reading materials should not be too easy for the reader, otherwise they will meet very few unknown words (Carver, 1994). It is therefore important, in order to maximize the opportunities for learning vocabulary from reading, to keep a balance between understanding most of the vocabulary in a text, but without the text being too easy.

At the level of individual differences, the ability to guess the meaning of words from context has been considered one of the most, if not the most, useful skills that comes into play in the process of vocabulary learning from reading, used by both L1 and L2 readers. However, it cannot be assumed that all students will necessarily be successful in its use. Research has shown a wide variation in the ability of learners to guess from context. Skilled guessers are good at knowing which clues to look for and where to find them in the context, but even when the learner is good at guessing from context, readers often make erroneous guesses, impeding the possibility of learning the new word's meaning. In addition to this, guessing from context is not a strategy that is equally applicable to all situations. The quality of the context is one of the main conditions for successful guessing, since not all contexts are equally informative. The context must provide enough and adequate clues to be able to guess a word's meaning (see Schmitt, 2000, and Nation, 2001, for a more detailed review on the conditions for successful guessing and inferencing).

Beside these linguistic and individual factors, perhaps the most important requirement relates to the amount and frequency of input. It is obvious that for all the above factors to be met, and to maximize the possible gains in vocabulary, learners need to get large, consistent, and sustained amounts of exposure. As Schmitt (2000) points out, "Reading can provide a good context for incidental learning, although only large amounts of it are likely to lead to any significant vocabulary improvement" (p. 158).

Reading Materials for Vocabulary Learning

Among the different types of reading materials and programs, a common distinction has been that between "extensive reading," that is, wide reading for pleasure in which the focus is on understanding the text, and "intensive reading," that is, reading which involves the close deliberate study of short texts (Nation, 2001). When deciding on the reading materials and programs to use, it is important not only to think about what students do with each reading activity, but also what students can gain from each activity. Extensive reading appears to be more beneficial for enhancing and consolidating the knowledge of partially known words, because it entails many exposures, multiple encounters, and the opportunity to recycle words (Waring & Takaki, 2003). In contrast, intensive reading seems to be more effective for learning new vocabulary, particularly the form-meaning link, because of the more explicit attention given to the words. However, it will probably not

lead to much depth of knowledge, simply because there is usually not enough time to cover the various word knowledge aspects.

For lower-level students, “narrow reading,” that is, the reading of numerous authentic texts but all on the same topic, might be an appropriate option (Schmitt & Carter, 2000), since it will ensure important conditions like repetition of the topic-specific vocabulary, recycling, and familiarity with the topic, something that would not be that easy to find in unrelated stories. Narrow reading on a topic which is of real interest to the students will also have a positive effect on their motivation.

The use of authentic texts might not be appropriate for beginner students, who will benefit more from materials like “graded readers,” books written with a controlled vocabulary and a limited range of grammatical structures and typically graded into a number of levels. The characteristics of the design of these series ensure important conditions in vocabulary learning like repetition, recycling, opportunities for consolidation, ease of topics, amount of input, words frequency, and so forth. Nowadays a number of publishers have interesting series of graded readers. *Penguin Readers* from Pearson Longman publishers are a good example of graded readers, starting with the “Easystarts” level, which contains 200 headwords, going up to 3,000 headwords in level 6, and with topics such as fantasy and adventure stories, celebrities’ biographies, and adapted classics. The small vocabularies with which graded readers start (e.g., 200 headwords for *Penguin Readers* or 400 headwords for *Oxford Bookworms* series) means that even beginner students can start reading from the early stages of learning.

The selection of the best reading program and materials will depend on the overall learning environment and the specific learners’ characteristics and needs. Through teachers’ careful consideration of all the different factors outlined above, and the adequate and appropriate selection of reading materials and activities, the possibilities of mutual support and reciprocity between vocabulary and reading will be maximized, and both reading comprehension and vocabulary learning from reading will therefore be more likely to occur.

Vocabulary Learning Strategies

YONGQI GU

Vocabulary learning strategies (VLS) are intuitively appealing to teachers and learners. This is partly due to the difficulty and conspicuousness associated with vocabulary in language learning. Learners of a foreign language are confronted with vocabulary learning right from the very beginning; and it is a never-ending task. It is, therefore, practically useful and theoretically interesting to study the ways students go about learning vocabulary and to find out the effectiveness of various strategies.

VLS represent learners' conscious efforts in managing their own learning of vocabulary in order to make it more effective and more efficient, in increasing the vocabulary size and in being able to use the words learned. Studies of VLS in applied linguistics started in the late 1980s (Ahmed, 1989). VLS has now become a popular research topic.

What VLS Do Students Use?

Considerable efforts have been invested into discovering the range of VLS students naturally use. Bottom-up procedures are normally first used to elicit as many VLS as possible (e.g., Gu, 2003a). Top-down and interactive procedures are then used to put these strategies into theoretically plausible categories (e.g., Schmitt, 1997). This has resulted in a few taxonomies (e.g., Gu & Johnson, 1996; Schmitt, 1997). Table 1 shows one of these taxonomies which tries to include the whole range of VLS (Gu, 2010).

Are VLS Useful?

Most research so far has demonstrated a meaningful relationship between vocabulary learning strategies and learning results either through a correlational approach (e.g., Gu & Johnson, 1996; Kojic-Sabo & Lightbown, 1999; Fan, 2003) or by establishing strategy similarities and differences among learners with different degrees of success (Moir & Nation, 2002).

Two types of learning outcome measures have been used: language proficiency and vocabulary. Those who use the general language proficiency measure tend to find positive and significant correlations between VLS and language proficiency. For example, Mizumoto and Takeuchi (2008) investigated the effect of VLS on TOEIC performance among a group of Japanese students and found that, among a group of variables, "vocabulary learning strategies as a whole had the greatest influence on TOEIC scores" (p. 17). Gu and Johnson (1996) used both a general proficiency measure and a vocabulary size measure. However, despite a general positive correlation between VLS and English proficiency and vocabulary size, Gu and Johnson reported that some strategies aimed at vocabulary retention correlated significantly with vocabulary size but not with general proficiency. This suggests a dynamic and prolonged nature of vocabulary development from initial linking and storage of form-meaning pairs (reflected to a certain extent in passive vocabulary size) to a gradual shift of these words to the active stock, and finally to an integration of words into the general language competence. A wide array of VLS, therefore, should be used at different stages

2 VOCABULARY LEARNING STRATEGIES

Table 1 Categories of vocabulary learning strategies

	<i>Dimensions</i>	<i>Categories</i>	<i>Strategies</i>
Metacognitive	Beliefs	Beliefs about vocabulary learning	Words should be memorized Words should be learned through use
	Strategies	Metacognitive strategies	Selective attention Self-initiation
Cognitive	Initial handling	Contextual Guessing	Wider/global context Immediate/local context
		Dictionary strategies	Dictionary strategies for comprehension Extended dictionary strategies Looking-up strategies
		Note-taking strategies	Meaning-oriented note taking Usage-oriented note taking
	Reinforcement	Rehearsal strategies	Use word lists Oral repetition Visual repetition
		Encoding strategies	Association/elaboration Visual encoding Auditory encoding Use word structure Semantic encoding Contextual encoding
	Activation	Active use	Activation strategies

of learning to commit words to memory and to automate the use of these words in real language use contexts.

The overwhelming majority of vocabulary measures in VLS studies have been some type of passive vocabulary size measure, in other words the number of words a learner can recognize. Probably due to the difficulty in designing an active vocabulary size measure, very few studies have investigated the effect of VLS on the development of active vocabulary.

Person, Task, Context, and Strategies

Research suggests that the choice, use, and effectiveness of VLS hinge on who the learner is, what the task at hand demands, and under what conditions the learning is taking place (Gu, 2003b). When learners find it difficult to learn a certain aspect of vocabulary, they will initiate the use of VLS. As such, some strategies are more related to the learner than to the task of learning, while other strategies are triggered by the learning task and are therefore closer to the task than to the person. Even the same learner attempting the same task may change strategies when s/he perceives the different demands of varied contexts.

Learners and VLS

Learners have their preferred ways of learning. Individual differences such as personality, learning styles, motivation, age, and gender differences, together with their differences in learning background and current level of language proficiency, determine to a large extent how a learner approaches a vocabulary learning task. These person-dependent factors are

relatively stable, and are usually more related to the management and control of learning, for example, planning, monitoring, and evaluating.

A number of studies have shown different approaches to vocabulary learning that are related to learning styles. Sanaoui (1995) identified two approaches to vocabulary learning, a structured and an unstructured approach. The first group approached vocabulary learning in a systematic way, setting criteria for the selection of words, engaging in self-initiated learning activities, keeping a systematic note of vocabulary items being learned, and regularly reviewing their records. The other group, by contrast, did little independent learning, kept minimal records of new words being learned, and relied heavily on classroom instruction. Moreover, they did not know what words to focus on, often depending on what the teacher wrote on the board. Sanaoui suggested that the structured approach showed better learning results than the unstructured approach. She also noted that the two approaches should be two ends of a continuum, and that most learners might fall somewhere in between the two ends. Likewise, in Parry's (1997) case study, one learner employed a "holistic" approach, paying attention to overall understanding, and another learner used an "analytic" approach, spending considerably more time on guessing, analyzing, and intentional learning of each new word. Parry concluded that flexibility in strategy use is needed because "both approaches are necessary but . . . neither is appropriate at all times" (p. 18). This pattern was confirmed by Gu (2003a) who showed that two Chinese learners achieved success in different styles, one in a holistic approach that was likened to a "freehand" style in Chinese painting, and the other achieving a similar level of success in a methodical and detail-oriented manner that was labeled as "fine brush."

Other learner-oriented studies of VLS include learners' self-regulation in vocabulary learning and gender differences in strategy use. Tseng, Dörnyei, and Schmitt (2006) examined "the learner trait of self-regulatory capacity" (p. 85) in vocabulary learning, and studied the subjects' self-regulatory strategies in vocabulary learning in terms of five dimensions of self-regulatory control: commitment, metacognitive, satiation, emotion, and environmental control. Oxford, Lavine, Hollaway, Felkins, and Saleh (1996) discovered that females were significantly more willing than males to try out new vocabulary learning strategies.

The Vocabulary Learning Task and VLS

Learning would not be strategic if a learner tried to use the same strategy for all purposes. In fact, analysis of the learning task at hand and matching task demands with the learner's own strategic resources are crucial features for strategic learning. The vocabulary learning task can be examined from various perspectives: vocabulary breadth, depth, and automaticity; active versus passive vocabulary; types of vocabulary; as well as stages of vocabulary learning. Different aspects of vocabulary are best learned through different strategies.

The lion's share of attention has been on vocabulary size/breadth, that is, the number of words a learner knows. Most research focuses on how effective various VLS are for the retention of paired associates between the form and one meaning of a word. By far the most studied strategies are various mnemonic devices such as the keyword method, where a sound-alike word in the L1 is associated with the target word and a visual image showing the L2 target word and the L1 sound-alike doing something together serves as the meaning link between the two. Despite robust evidence showing the superiority of mnemonic devices over other strategies such as rote repetition, learners are warned not to over-rely on these memory tricks (Gu, 2003b), simply because real vocabulary learning in a foreign language is well beyond the retention of form-meaning pairs.

In addition to comparing the effects of various VLS provided by experts, many studies have looked at various self-selected uses of VLS in remembering paired associations (e.g., Barcroft, 2009). These studies tend to find that strategies such as repetition are not only

used widely by learners of various backgrounds, they are perceived to be useful strategies as well.

In general, however, when the retention of meaning is involved, the “depth of processing” theory (Craik & Lockhart, 1972) applies, in that the more learners deeply engage themselves in the learning process, the better the retention. This theory is developed further in the involvement load hypothesis (Hulstijn & Laufer, 2001), in which task-induced involvement is analyzed in terms of need, search, and evaluation.

Compared to the retention of meaning, VLS for the learning of different shades of meaning for each word (depth) and for the fast retrieval of it from long-term memory (automaticity in use) have received little research attention. What has been found both in applied linguistics (e.g., N. Segalowitz, Watson, & S. Segalowitz, 1995) and in experimental psychology point to the conclusion that the skill aspect of vocabulary is best learned through implicit learning and repeated exposures in textual and sociolinguistic contexts (Ellis, 1994), and as such, is governed by the power law of learning.

Another perspective to the vocabulary learning task is the existence of four different types of vocabulary (Nation, 2001) that are very unequally distributed: high-frequency words, academic vocabulary, technical vocabulary, and low frequency words. The first 2,000 most frequently used words appear in over 85 percent of all texts (Nation, 2001); 570 nonfiction, academic words (Coxhead, 2000) cover less than 10 percent of school-related texts. A small number of technical words are used only in specific domains and are only needed when learners engage themselves in these domains. The remaining overwhelming majority of words are not often used and represent only about two percent of ordinary texts. Clearly, knowledge of the uneven nature of vocabulary distribution will lead to strategic redirection of attention no matter who the learner is.

An advancement of knowledge in vocabulary studies within the last decade or so is the knowledge of chunks or formulaic sequences. As yet, however, there is no reported study of whether learners deploy strategies different from the learning of single words. Nonetheless, earlier studies (e.g., Ahmed, 1989; Sanaoui, 1995; Gu & Johnson, 1996) not designed for this purpose did find that successful learners pay special attention to idioms and set expressions.

Learning Context

In the chemistry of language learning, when researchers focus on learners, they see the power of the learning task; when they examine the task, the importance of the learner as an agent will immediately emerge. All this time, they see the importance of learning context in supporting or constraining the students’ choice and use of strategies. One such example is the perceived Asian learner’s preference for rote strategies in vocabulary learning. Explicit research focus on the context of learning in VLS, however, is only beginning to be seen. Gao’s (2003) interviews among a group of Chinese students studying in the United Kingdom revealed vividly how contextual changes brought out dramatic changes in task demands and input/output opportunities in vocabulary learning, and how these students had to abandon their trialed and useful memorization of words. Similar results were found (Gu, 2010) among a group of students who moved from China to Singapore. In fact, even within the same country, Cortazzi and Jin (1996) were able to show that students adjusted their VLS after they moved from secondary school to university.

Conclusions

VLS are indispensable in describing and explaining the vocabulary development of a foreign language. VLS can also empower learners in making wise decisions as to what to

learn and how to learn it. Research on VLS has produced many insights for learners and teachers of a foreign language. Foremost among these would be the debunking of a widely held myth that vocabulary learning is a matter of increasing vocabulary size, and that VLS good for short-term retention of paired associates would be good enough. We now know that there are rarely absolute good or bad strategies for vocabulary learning. The appropriateness and effectiveness of VLS depend on the learner's own purpose, stage of learning, which aspect of vocabulary is being focused on, and the sociocultural supports or constraints. Successful vocabulary learners are active learners who take their own initiative and are selective; they analyze the vocabulary learning task at hand, and analyze themselves as learners before they plan in detail. Successful learners also monitor their learning process and make constant strategic adjustments along the way, evaluate the usefulness of strategies, and provide internal feedback to themselves. When we marvel at successful learners flexibly orchestrating their VLS, vocabulary learning becomes an art.

Vocabulary Loss in the First Language

MIRELA CHERCIOV

Of all areas of linguistic knowledge which can be lost in language-contact situations, vocabulary is the linguistic domain in which change can be seen first (Andersen, 1982). The dynamics of the mental lexicon have been extensively studied within the field of second language acquisition (SLA). However, less attention has been devoted to date to vocabulary loss in the first language (L1). Other contexts in which vocabulary loss can occur are aging dementia (Goral, 2004) or neurological impairment, such as aphasia or cognitive-communication deficits (Ferguson, 1991). This entry focuses on L1 vocabulary loss (as evident mostly through lexical-retrieval difficulties in online production) in long-term bilinguals who live in an environment where a second language is dominant. The entry outlines the predictors that lead to vocabulary loss, the indicators of loss, and the research designs and findings in this area of L1 loss.

Predictors for Vocabulary Loss

The loss of the L1, which in the context of the present entry refers mainly to the loss of L1 vocabulary, occurs typically in two circumstances. One common context is in migration settings where the speakers live in a country in which their native language is not the dominant language and, as a result, the migrants experience L1 loss or attrition. The other setting in which vocabulary loss can happen is in the case of indigenous minority languages, where the language varieties are about to disappear. Although in both circumstances the final outcome is complete or partial loss of the first language, there are notable differences between the two situations. In the case of the transplanted migrant language, the loss is confined to the individual level and is considered to take place within one generation. In the case of minority-language shift, loss occurs on a community-wide level and usually spans several generations. Nonetheless, in both circumstances, language loss is ascribed to two main factors: the lack of L1 input coupled with the presence of another dominant language (the L2). First, for the migrant speaker, there is often a major reversal in the utility of the mother language: In the new environment, the migrant's use of the L1 is confined to interactions with the rather restricted circle of migrants from the home country. With respect to L2 dominance, the typological distance between the L1 and the L2 can also influence the rate of vocabulary loss. There is more crosslinguistic influence (including, among other related aspects, transfer, interference, semantic extensions, borrowings) between languages that belong to the same language family than between languages that are less closely related (Cenoz & Genesee, 1998). From a sociolinguistic point of view, loss also occurs where there is a difference in prestige and levels of official support for the two languages concerned (Dorian, 1982, p. 44). In addition, there are also individual factors, such as attitudes toward the L1 and the L1 culture, education profiles, or patterns of language choice and use. For example, empirical validations of the correlation between attitudinal and personal background factors and patterns of L1 loss were clearly established in qualitative analyses conducted at the individual (Prescher, 2007; Cherciov, 2011) as opposed to the group level (Yağmur, 1997; Hulsen, 2000).

Increased Vulnerability of the Vocabulary

The increased vulnerability of the mental lexicon is not surprising. Schmid and Köpke (2009) list some of the aspects that cause vocabulary knowledge to be an especially “sensitive” part of the linguistic system in the context of loss. First, the lexicon is numerically larger than all the other areas of language knowledge. Unlike the grammatical and the phonological system, vocabulary is an “open class” system. Lexical development takes place across the life span in both bilingual and monolingual environments where new items are relatively easy to add (Schmid, 2011). The lexicon’s greater flexibility implies that these items are less densely connected than the items in the inventories of other domains of language knowledge, which, in turn, allows for greater adaptability in the face of changes or loss. In other words, if relatively minor changes in the phonological and morphological systems can have far-reaching implications, the lexicon can adapt more easily and incorporate these changes without the restructuring of the whole system. Meara (2004), in an innovative approach involving computer simulations of lexical loss, shows how the loss of a certain amount of lexical knowledge could take place without dramatic consequences for the whole system (see the suggested readings below for other models of vocabulary loss).

In her work on language death, Dorian (1973, p. 414) has noted that lexical loss in Scottish Gaelic was the aspect most acutely experienced by the participant in her study: “Explicit comments on the decline in the quality of their Gaelic focus almost entirely on the lexicon.” Dorian (1978, pp. 590–1) also notes that, in other studies of language death, the linguistic area most reduced and impoverished is the lexicon. In the context of L1 attrition, Romanian migrants in Canada also listed vocabulary loss as the most perceivable manifestation of L1 attrition (Cherciov, 2011). Other examples of reports on the perception of lexical/semantic loss include Hutz (2004), Ammerlaan (1996), and Pelc (2001).

Indicators of Vocabulary Loss

Seliger and Vago (1991) point out that there are generally two driving forces for language change: an external force and an internal force. First, the internal force refers to the inherent tendencies languages display when in the process of regression: increased internal simplicity, increased regularity, and increased efficiency for meeting immediate communicative needs (Yukawa, 1997, p. 9). According to Andersen’s (1982, p. 94) hypotheses, the language attriter in comparison to a competent speaker will have: a smaller number and a smaller variety of lexical items, an impoverished lexicon in those areas with little or no recent experience, and a high number of gaps of less common, low-frequency, highly marked items. The second force shaping language change, the external force, is the equivalent of what Sharwood Smith (1983) labels “cross-linguistic effects” from the second language (L2), which include interference/transfer, borrowings, convergence, and avoidance.

Pavlenko (2004) presents a unified view of the internal and external triggers shaping L1 attrition and proposes the five indicators for L1 vocabulary loss presented below: borrowing, restructuring, convergence, shift, attrition (see also Schmid & Köpke, 2009).

1. *Borrowing.* This process refers to the morphological and phonological integration of L2 elements into the L1. This phenomenon is especially frequent in migrant speech when features that are different from those in the migrant’s country of origin are being described. For example, research on vocabulary loss has pointed to an increase in borrowing frequency especially in language used to describe the public sphere of the L2 country, such as immigration, work- or school-related situations, economy, the health system, or the army (see Ben-Rafael & Schmid, 2007, for examples from the

spoken French of migrants who live in Israel). Arguably, borrowing can be viewed as an enrichment to the L1 system and not as a loss (Schmid & Köpke, 2009): The results of such phenomena are not an indication of the unavailability of previously existing elements, but of the expansion of the L1 vocabulary to incorporate new concepts and items. In one of the few longitudinal studies in the attrition literature, where the written correspondence of a long-time German migrant in the USA was analyzed, Hutz (2004) does not consider instances of strategic borrowing (where the loanword is used to fill the gap between the communicative intention and the actual L1 knowledge, as in *Ich benutze einen "Walker"*—‘I use a walker now’) and necessary loanwords (where the loanword is used when there is no equivalent to express the same concept in the L1, as in *Die Kinder sind in der "Junior High-School"*—‘the children are in Junior High-School’) as manifestations of vocabulary attrition. On the contrary, these are considered a form of language gain and a new communication strategy.

2. *Restructuring*. In this type of interference, the meaning of existing L1 words is over-extended according to the semantic scope of the corresponding L2 item. Other terms used to refer to the process of restructuring include loanshifts or semantic transfers (see Hutz, 2004). Hutz, for example, cites the German verb *gehen* (‘to walk’), whose meaning is restructured to correspond to that of English, which leads to overextended uses such as *Er *geht mit dem Flugzeug zurück* (‘He goes back by plane’).
3. *Convergence*. In this type of language change, the meanings of L1 and L2 concepts create one single form that is different from both the L1 and the L2 terms, the result being a greater similarity between the two languages in contact. One example of convergence is the appearance of *evidentials* in a language that did not have them previously, as described in relation to the Spanish of Quechua speakers (Sánchez, 2004). Note that noncontact Spanish marks evidentiality optionally through lexical means (with adverbials such as “apparently,” “I heard that,” etc.).
4. *Shift*. This process refers to the changes of L1 items toward the norms specified by the L2. The end result of this process is complete loss of the L1 or assimilation to the second language.
5. *Attrition*. This process is characterized not only by a change in the system, but by a reduction of the lexicon to a certain degree. It is this process that Andersen’s hypotheses mentioned above attempt to model. When bilinguals encounter difficulties in retrieving specific L1 items, they often use hesitation phenomena to buy time, or resort to code switching as a last resort for overcoming lexical inaccessibility. Such strategies are used mostly with items that are rather infrequent in daily life or that refer to precise terms (for a variety of examples see Ben-Rafael & Schmid, 2007).

Quantifying Vocabulary Loss

The methods used to investigate vocabulary loss fall into two categories: those that investigate vocabulary reduction as apparent in samples from spontaneous production (lexical diversity, lexical richness, and lexical accessibility) and those that examine loss via formal data-collection instruments (the verbal-fluency test [VF] and the picture-naming and matching task [PNMT]). This section describes the tools applied in the context of spontaneous speech production (following Schmid, 2011) and reviews the VF task and the PNMT (following Schmid & Köpke, 2009).

Lexical Diversity

Decrease in lexical diversity in L1 naturalistic speech has been traditionally investigated by using the type–token ratio (TTR). TTRs are calculated based on a stretch of discourse

4 VOCABULARY LOSS IN THE FIRST LANGUAGE

and they measure: (a) the total number of words contained in the discourse (tokens), (b) the number of different words or lemmata (types), and (c) the ratio between the two (types divided by tokens). A low TTR value indicates a decrease in vocabulary richness. TTRs are calculated based on stretches of discourse of equal length from each data sample (1,000 words). Limiting the transcript is crucial since spoken language contains a high number of repetitive function words, which, in turn, cause the TTR value to decrease in longer texts. Given that the TTR is sensitive to data samples of varying length, a new tool, in the form of the lexical-diversity measure (D) has been developed by Malvern and Richards (2002). The D value uses a formula that is based on random sampling of repeated stretches of speech. Most recent research in lexical loss has used the D value to establish differences between a migrant group and a control group. Dostert (2009), in a study involving long-term British and Irish speakers living in Germany, found no difference between the two groups. In a similar study design (Cherciov, 2011), this time involving Romanian speakers living in Canada, the D measurement again revealed no statistically significant difference between the migrant and nonmigrant groups. These results suggest that measuring vocabulary loss only in terms of a “wholesale reduction of lexical diversity” (Schmid, 2011) is not sufficient. More in-depth measurements, such as lexical frequency and richness profiles, are necessary to shed light on indicators of L1 vocabulary loss.

Lexical Richness

Andersen (1982) indicates that attrition affects particularly those lexical items which occur with relatively low frequency. This could imply that even if two people obtain very similar TTRs or D values, one can still exhibit a sort of vocabulary loss by using more frequent lexical items rather than less frequent items to describe the same set of circumstances. Therefore in addition to “blind” measures of lexical diversity, such as TTRs and D values, other factors, such as the rarity of the lexical items used, should be considered. To this effect, Schmid (2002) found that the German migrants in her study differed in terms of lexical diversity and sophistication and that there was a positive correlation between TTR ratios and lexical richness.

Lexical Accessibility

While all speakers resort to various “time-buying” strategies to solve occasional word-finding difficulties, speakers for whom the L1 is in the process of attrition are expected to use an increased number of hesitation phenomena in their speech. Hesitation or disfluency markers have several functions, broadly ranging from semantic to cognitive.

In general, semantic disfluency markers—which include filled pauses—are used by the speaker to lend emphasis to a certain discourse element (Clark & Fox Tree, 2002; de Leeuw, 2007) and cognitive disfluency markers—which include empty pauses, repetitions, and reformulations—are typically employed as strategies associated with the resolution of lexical-retrieval problems (Clark & Fox Tree, 2002). Schmid and Beers Fägersten (2010), in an investigation of L1 German attriters living in a Dutch-speaking and an English-speaking environment, showed not only that the frequency of disfluency markers increases in the process of L1 attrition, but also that the analysis of the syntactic placement of disfluency markers (i.e., before nouns and verbs) indicated that hesitation strategies were mainly used in connection with a slowdown in the retrieval of lexical information.

Verbal Fluency (VF)

In a verbal-fluency test, the participant is asked to produce as many items as possible pertaining to a particular category in a given time period, ranging from 60 to 120 seconds. The most common categories are semantic, such as animals, or phonemic, such as words

that begin with the sound “p.” The assumption behind VF is that a higher number of items named in a limited period of time is indicative of the subject’s better lexical access and therefore his or her higher linguistic proficiency (Schmid, 2007). In general, the VF test appears to produce significant findings: L1 attriters obtain lower scores than the monolingual controls. Schmid and Köpke (2009), however, observe that, while intergroup differences with respect to VF performance are clear-cut, attempts to account for within-group differences have not been entirely successful (see Schmid & Köpke, 2009, for a review of the assumptions behind VF tasks and the various findings in attrition studies).

Picture-Naming and -Matching Tasks

In both picture-naming and -matching tests subjects are presented with a series of pictures. The picture-naming test is a retrieval test and requires the participants to say or to write down the name of a pictured object as quickly as possible. The picture-matching test is a recognition task and involves identifying the name of the item in the presence of four semantic stimuli (e.g., to match an “apple” from pictures of apple, pear, orchard, and glove). This type of test is designed to measure accuracy and response time (see Schmid & Köpke, 2009). The tasks can be used to shed light on specific instances of lexical transfer between the L1 and the L2, such as issues of *categorization*. Pavlenko and Malt (2011, cited by Schmid, 2011) showed that Russian American speakers changed the criteria on which they based their categorization of an object, for example, they tended to call the pictured object of a cup *chashka*, while Russian speakers living in Russia preferred *riumka*. This is an example of how such tests can capture the subtle changes in the lexicon of an attriter, changes which would not have been detectable by using other types of tasks (Schmid, 2011).

Final Remarks

Four important aspects have been discussed in this entry: the type of indicators associated with vocabulary loss, the circumstances and factors triggering vocabulary loss, the increased vulnerability of the lexicon in comparison with other types of linguistic knowledge, and the types of research designs used to investigate loss in the lexicon. According to the studies reviewed above, vocabulary loss refers to both internal changes, such as reduced lexical-retrieval capacity and attrition of lexical items, and external changes, such as various manifestations of crosslinguistic influence. The increased vulnerability of the lexicon appears to be due to its open-class characteristic, as well as to its overall capacity to absorb change. With respect to impacting factors, vocabulary loss in the L1 is the result of the reduced L1 input and increased dominance of the L2. Moreover, personal factors, such as *attitudes*, appear to strongly impact the rate of loss, especially at the individual level. As for research design, an approach using multiple data-collection methods is necessary to thoroughly investigate the nature of vocabulary loss in the L1 and, potentially, create a more uniform account of the processes involved in language loss.

Vocabulary Size in the First Language

BEVERLY A. GOLDFIELD

As adults, we understand and use many words in our daily interactions with people, texts, and tasks. Most of us would be surprised at the size of our vocabulary. Educated, English-speaking adults, for example, estimate their own vocabulary at 1–10% of its actual size, which may average as many as 150,000 words that can be comprehended and potentially used (Seashore & Eckerson, 1940). These figures are based on research that initially defined “word” as a dictionary entry and included common, frequently used words (e.g., *song*, *sing*), compounds (*songbird*), and derivatives (*singer*) of these words, and words used less often or in specialized contexts (e.g., *cantata*). How do we come by such richness?

The origins of our lexical accomplishments begin very early in development. Although infancy is defined as the period of development when we are “without speech,” our word-learning capacities are firmly rooted in the perceptual biases, cognitive mechanisms, and social interactions that characterize the first year of life. This entry will explore the beginnings of word learning, trace its developmental trajectory from infancy to adulthood, and examine factors related to the size and scope of our lexicon.

Segmenting Words

Words are acoustic signals that differ across speakers, embedded in the larger frame of connected speech. Word learning is, at the outset, a formidable task that involves segmenting a word form and mapping it to a concept or meaning. How do infants find words in the flow of speech? Word segmentation builds on the newborn’s initial bias to tune into human speech (first heard in utero) and perceptual capacity to discriminate many kinds of phonetic contrasts. During the first year of life, infants make use of the stress patterns, phonotactic cues, and transitional probabilities of the input language to begin to segment words from speech. Caregivers assist by using shorter utterances, long pauses, single words, and slower, clearly articulated speech with their infants. Clearly articulated consonants in maternal speech have been correlated with infant speech perception (Liu, Kuhl, & Tsao, 2003) and both hyperarticulated vowels and slower speech have been found to enhance word comprehension (Song, Demuth, & Morgan, 2010).

First Words Comprehended and Produced

The earliest studies to observe vocabulary development were in the form of diary entries by scientists who used their training to systematically record the development of their offspring. Darwin (1877), for example, observed that his son understood the name of his nurse at the age of 7 months, five months before his first spoken word, *mum*, which he used to request food. Currently, researchers use multiple methods to investigate vocabulary development. At earlier ages, researchers rely on parental report, systematic observations, and laboratory procedures. For older children and adolescents, methods include analysis of interactive speech and of written texts and laboratory testing.

Word learning begins with comprehension as early as 6 months of age, when children demonstrate their understanding of *mommy* and *daddy* (Tincoff & Jusczyk, 1999). Most

2 VOCABULARY SIZE IN THE FIRST LANGUAGE

children begin to comprehend additional words between 8 and 10 months of age, with considerable variation in the number of words understood. For example, the receptive vocabulary norms of the MacArthur–Bates Communicative Development Inventories (CDIs), which are based on a vocabulary checklist completed by parents, indicate that the number of words comprehended at 8 months varies from 0 to 260 words, with a mean of 42.3. Word comprehension grows rapidly. At 12 months of age, the checklist data indicate that the average number of words comprehended has doubled to 84.4 (range = 7–262), and by 18 months that average has tripled (251.5; range = 30–395; Dale & Fenson, 1996). Longitudinal studies of individual children based on observational data supplemented by parental diaries or interviews report more conservative estimates, with comprehension of 0 to 50 words between 8 and 10 months of age, 0 to 100 words at 12 months, and 80 to 200 words at 15 months (Benedict, 1979; Harris, Yeeles, Chasin, & Oakley, 1995).

Most children begin to say words as they approach their first birthday, often many months after the onset of comprehension, and this gap between comprehension and production is a consistent feature of lexical development. For individual children, Harris et al. (1995) found a lag of between two weeks and five months for first word comprehended versus first word produced. Benedict (1979) reported that, on average, children understood 50 words before they could produce 10 words and achieved a productive lexicon of 50 words five months after reaching the same milestone in comprehension. Production continues to lag well behind comprehension into the second year. The CDI norms indicate an average productive vocabulary of 10.2 words (range = 0–66) at 12 months and 86.7 words (range = 4–327) at 18 months of age (Dale & Fenson, 1996). Longitudinal studies of individual children have noted an acceleration in word learning, or “vocabulary spurt,” as children’s productive vocabularies approach 50 words (Goldfield & Reznick, 1990). For both comprehension and production, there is a consistent sex difference favoring girls, but the difference is small, typically accounting for 1–2% of the variance.

There are other asymmetries in the relationship between comprehension and production during this early period of vocabulary growth. The correlations between total words comprehended and total words produced tend to be weak, most likely due to children who initially say very few of the many words they comprehend. Another asymmetry concerns the types of words in the two lexicons. Most studies of English-speaking children using varied methodologies report a large proportion of nominals, or words for objects, and very few verbs, or words for actions and events, among the first 100 words children say. This pattern for productive vocabulary has been replicated using parent checklist data in children learning Spanish, Dutch, French, Hebrew, Italian, and Korean (Bornstein et al., 2004). Vocabulary data based on speech samples, however, indicate that children learning Mandarin (Tardif, 1996), Korean (Choi, 1997), and Tzeltal (Brown, 1998) use verbs earlier and more frequently than English-speaking children. In these languages, sentence subjects are often omitted in conversation, leaving the verb in the more salient sentence-initial position. Spontaneous speech data for children learning German also demonstrate a weaker noun bias. At 13 months, German-speaking children used primarily relational terms (e.g., *weg*, ‘allgone’) and personal–social words (*danke*, ‘thanks’). The proportion of nouns used in speech grew during the second year, but verbs constituted the largest word class used at 36 months (Kauschke & Hofmeister, 2002). Although children learning English produce few verbs, they appear to comprehend verbs much earlier. The tendency of English-speaking children to say more of the nouns and fewer of the verbs that they know may be related to pragmatic features of the speech used by parents, who encourage children to comprehend verbs (*throw the ball to mommy*) but produce nouns (*can you say “doggie”?*; Goldfield, 2000).

A number of factors predict vocabulary size in the first three years of life. Some factors may be related to biological advantage or maturation. For example, infants with advanced

ability to perceive vowel distinctions at 6 months have larger productive vocabularies at 24 months (Tsao, Liu, & Kuhl, 2004). There is mixed support for the relationship between family socioeconomic status (SES) and early language development, in part due to the varied ways in which SES is operationalized. More specific factors, such as maternal responsiveness to children's verbalizations and amount of input do correlate positively with vocabulary growth (Huttenlocher, Haight, Bryk, Seltzer, & Lyons, 1991; Hart & Risley, 1995). Huttenlocher et al. also found that the relative frequency of specific words in parents' speech was highly correlated with the order in which those same words were learned by children.

Preschool Vocabulary

During the preschool years, productive vocabulary grows from about 200 words at age 2 to as many as 10,000 words at age 6, or more than five new words per day (Bloom & Markson, 1998). During this period, children expand their vocabulary in many ways. For example, children learn that things can have more than one name. Early word-learners assume that an object or entity has a single name, a bias called "mutual exclusivity" (Markman, 1992). This bias initially assists children to learn new words. When an adult uses an unfamiliar word, the child looks for an object for which she does not have a name. However, children must eventually overcome this bias to learn that the same entity can be referred to in many ways and at different levels of specificity, as in *poodle*, *dog*, and *animal*. Adults often help by pointing out the categorical relationship, as in *That's a poodle; it's a kind of dog*. Children's verb vocabularies also expand. First verbs tend to be general-purpose terms frequently used by parents, such as *get*, *go*, *put*, and *do*. Later verbs refer to more specific activities (*run*, *jump*) and accomplishments (*find*, *make*). Preschoolers also learn verbs that specify mental states, such as *think*, *know*, *remember*, *forget*, *feel*, and *pretend*.

Preschoolers also add words for size, shape, color, location, and number. At first, children make general size distinctions, as in *big* versus *small*; later they acquire the more specific contrasts, such as *tall*–*short* and *wide*–*narrow*. Although even 2-year-olds may occasionally produce a color term, words for color are not used accurately until age 4 or later. Similarly, some 2-year-olds may be able to count from 1 to 10, but they will not understand the relationship between word and quantity for another year or two. Preschoolers also create novel words (e.g., *sky-car* for airplane) when they forget a word or encounter a gap in their lexicon (Clark, 1993). Children learning English begin to sort out those words that are inflected in regular fashion (*cookie*/*cookies*; *talk*/*talked*) from those that are irregular (e.g., *mouse*/*mice*; *go*/*went*/*gone*), eventually dropping their initial "errors" (*mouses*/*mices*; *goed*/*wented*).

Although preschoolers can learn new words rapidly, by "fast-mapping" a word to its referent after brief exposure to the word, it is important to note that word meanings will be expanded, refined, and related to other words in the lexicon in the coming years. Several factors, perceptual, cognitive, and linguistic, make rapid vocabulary growth possible. First, children are now able to process speech information more quickly (Fernald, Perfors, & Marchman, 2006), more easily recognizing familiar words and distinguishing them from words that are not yet understood. Second, cognitive attainments make it possible for children to learn words that encode abstract concepts, such as quantity. Finally, children also begin to discover new word meanings by using linguistic cues, such as by observing how words are used in sentences, a process called syntactic bootstrapping (Gleitman, 1990). Thus, the child who hears *Big Bird tweezles Cookie Monster* will conclude that the novel word refers to an action because of its position in the sentence. Adults also assist word learning by using new words in different linguistic contexts (*This is a rubber ball; it's made out of rubber*).

School-Age Vocabulary

The most rapid period of vocabulary growth takes place during the school years. Beginning at about age 6, children learn as many as 20 new words each day, achieving a vocabulary of about 40,000 words by age 11. Although parents and teachers continue to use and explain new words (Weizman & Snow, 2001), a dramatic change begins at this time as the primary source of word learning shifts from spoken communication to the written word. If we consider that 21 minutes of daily independent reading provide 2 million words per year (Cunningham & Stanovich, 1998), it is clear that reading is a major source of new vocabulary. Words in written texts tend to be more varied, abstract, and less familiar than words occurring in other forms of communication. Many of these words can be learned from the contexts in which they occur, as in: *The apothecary, who mixed the different drugs, placed his jars on the counter* (Sinatra & Dowd, 1991). Moreover, reading provides more individualized input into word learning, as children choose books about dinosaurs or space travel or the ruins of Pompeii. Increasingly, individual differences in the size and content of the lexicon are related to how much reading children engage in and the type of reading materials they prefer.

During the school years children expand their lexicons in several ways. Many new words are less frequently used or encode abstract concepts, such as *enigma* or *adversary*. Children learn vocabulary which is more precise, as in *topple* and *plummet*, verbs which convey additional information about the manner in which an object might fall (Berman, 2007). Other words are added as children analyze the morphology or structure of words into components and use this information to infer meaning. Morphological analysis can be applied to compound words (*apple* + *sauce* = *applesauce*), and words created by inflectional (*stride* + *ing* = *striding*) and derivational (*mis* + *interpret* = *misinterpret*) morphology. Children typically master inflectional morphology by age 6 or 7, but derivational morphology continues to develop into adulthood. School-age children also increasingly appreciate that many of the words they use may have more than one meaning, such as *bank* and *strike*, and this awareness of multiple meanings contributes to their understanding and enjoyment of jokes, puns, idioms, and riddles. Double-function terms, which have both a physical and a psychological meaning (e.g., *sweet*, *cold*), are only gradually understood; 6-year-olds comprehend the physical meaning, 8–10-year-olds the psychological meaning, but the relationship between the two is not appreciated until around 14 years of age (Schechter & Broughton, 1991). As vocabulary expands, word meanings become linked in the mental lexicon in more complex ways. The growth of semantic networks is illustrated by the syntagmatic–paradigmatic shift between 5 and 9 years of age, when children’s word associations change from sentence-like responses (*dog-barks*) to categorical responses (*dog-cat* or *dog-collie*). Thus, vocabulary continues to expand by adding new words, by refining and deepening the meanings of familiar words, and by expanding links between words in semantic networks that underlie word knowledge.

An important skill that underlies word learning during the school years is metalinguistic awareness, which is the ability to think about the language one uses. Metalinguistic awareness begins during the late preschool years when children begin to analyze words as sound units distinct from the objects and events these forms encode, a necessary foundation for reading. The school-age child becomes increasingly aware of new words and word meanings, and deliberately searches for meaning by examining how a word is used in context, by analyzing its structure, or by using the dictionary or thesaurus. To a large extent, the rapid pace of vocabulary development during the school years is supported by this ability to think about words old and new, combined with the quantity and quality of reading materials.

As adolescents encounter the demands of high school, vocabulary growth is advanced by classroom lectures and textbook reading in topics such as history, social studies, biology, and chemistry. Vocabulary development is also influenced by the ability of adolescents to engage in abstract thought and to apply their advanced metalinguistic competence to the analysis of spoken communication and written texts. High-school graduates typically achieve a vocabulary of 60,000 to 80,000 words, and prolific readers may understand and use twice this number (Aitchison, 2003). New words and advanced word knowledge continue to develop through direct instruction, contextual abstraction, and morphological analysis (Nippold, 2007). Students' encounters with various written genres produce familiarity with terms such as *interpretation*, *analogy*, *metaphor*, and *simile*. More of the words used by adolescents, especially in their expository writing, come from Latinate origins (e.g., *considerable*, *military*; Berman, 2007). Adolescents are also increasingly able to control language register, which is the level of language used in different social contexts. Thus, talking with peers evokes slang terms (*he is such a dude*) and colloquial forms (*no way*) whereas written school assignments require more formal vocabulary and carefully structured sentences. Written texts produced by adolescents incorporate vocabulary that is increasingly high in lexical diversity (the number of different words in the text), lexical density (the proportion of content words to total words), and lexical complexity (the proportion of polysyllabic words; Berman, 2007). Adolescents also continue to expand their use of familiar words, including metaphorical extensions of basic meanings, as in *eat your supper* versus *eat your words*.

Research shows that word learning continues throughout the life span, especially for those who are active readers. Moreover, the vocabulary of a language also evolves over time, with old words taking on new meanings and new words entering the lexicon. The word *text*, for example, has most recently come to mean something one does with print via a device originally developed for spoken communication (*I'll text her our new phone number*). Technological change is a major source of new words for all of us; consider *fax*, *byte*, *e-mail*, and *podcast*. As words are added and revised, our semantic networks reorganize to reflect new associations and connections. Technology, too, has taken a page from the human word-store with the creation of vocabulary databases such as WordNet. WordNet is a lexical database of English created by George A. Miller and colleagues. It currently includes approximately 118,000 nouns, 11,529 verbs, 21,479 adjectives, and 4,481 adverbs grouped in sets of cognitive synonyms (synsets), each expressing a different concept. Synsets are connected via conceptual-semantic and lexical relations. Thus, the size and scope of vocabulary in both humans and our computer-assisted technologies is a vast and formidable tool, with connections that extend and deepen with time and use.

Vocabulary Size in a Second Language

PAUL NATION

Problems in Measuring Vocabulary Size

Of all areas in applied linguistics research, measurement of vocabulary size has been the one most significantly affected by faulty methodology. Many of the problems which are involved in measuring total vocabulary size were recognized by Thorndike (1924), but his description of these problems and their solutions was published in a very narrowly circulated collection of papers and so remained largely unknown, except to a few of his students (Lorge & Chall, 1963), for well over 60 years. As a result, during that period of time, research on the vocabulary size of native speakers of English suffered from severe methodological flaws, making its findings misleading at best.

The major methodological problems stemmed from the fact that most vocabulary-size measures were based on sampling from a dictionary (Seashore & Eckerson, 1940; Diller, 1978). In such a study, a large dictionary is chosen, the number of entries in the dictionary is calculated, and then a representative sample of these entries is made. For example, a 1-in-100 sample may be made with each word in the sample representing 100 words in the dictionary. This sample is then used to make the items in the vocabulary-size test. A learner's score on the representative sample is multiplied by its relationship to the total size of the dictionary (in our example, 100 times) to find the learner's total vocabulary size.

Two major sources of error, among others, occurred in (a) the estimation of the total number of entries in the dictionary and (b) the sampling method. In the very worst pieces of vocabulary-size research, the number of entries in the dictionary was not counted, but the claims of the publishers were used instead. These claims are often wildly overstated.

The most common sampling method used was regularly spaced sampling based on the pages of the dictionary. So, for example, the first word on every 10th page was chosen. Because high-frequency words have more entries in a dictionary than low-frequency words, and because each entry for a high-frequency word takes up a larger proportion of the space in the dictionary, this method resulted in an over-representation of high-frequency words in the sample. Because high-frequency words are much more likely to be known than low-frequency words, this meant that a large proportion of the words in the resulting vocabulary test were answered correctly by those taking the test. This overinflated figure was then multiplied by an overinflated proportion based on a miscalculation of the number of words in the dictionary, resulting in ridiculous figures like the following: High-school seniors have a vocabulary size of over 200,000 words, and college professors a vocabulary size of around 250,000 words, with grade-school children learning over 10,000 words a year, and junior high-school children learning over 20,000 words a year (see, e.g., Diller, 1978). These figures are clearly ridiculous, given that a very large non-historical dictionary like *Webster's Third International Dictionary* contains around 120,000 word families (Dupuy, 1974; Nation, 1993). At present, our best rule of thumb is that up to the age of 20 or so, a native speaker's vocabulary grows at the rate of around 1,000 word families per year. This means that a 12-year-old will have a vocabulary of around 10,000 words, and a 20-year-old university student around 18,000 or 19,000 words. The vocabulary-size research described

above was conducted with native speakers of English. However, the methodological issues do not change when the vocabulary size of non-native speakers is measured.

Frequency-Based Tests of Vocabulary Size

Recent tests of vocabulary size intended largely for non-native speakers of English have used an alternative method of finding the words to test. Rather than using a dictionary, word-frequency lists are used. The methodology involves (a) deciding on the nature of the unit to be counted (word type, lemma, or word family); (b) choosing or creating an appropriate word-frequency list; and (c) making a stratified sample of words to test by sampling from each of the frequency levels in the word-frequency list (Meara & Jones, 1987; Nation & Beglar, 2007; Beglar, 2010).

Although this method of sampling largely solves the major problems described above, other problems remain. A major problem is that, although there is a reasonably strong relationship between word frequency and the likelihood of a word being known, the frequency of lower-frequency words is very much dependent on the nature of the corpus used to measure these frequencies. In addition, while frequency of occurrence is likely to work quite well in the first 10,000 words of a language like English, the learning of lower-frequency words is much more likely to be affected by specialist interests which can differ greatly from individual to individual. It is thus very difficult to design general-purpose vocabulary-size tests which are likely to give due credit for vocabulary knowledge in specialist areas.

Another major issue concerns what a vocabulary-size test measures. Does it measure vocabulary that has been learned, or does it measure vocabulary knowledge? For example, Daulton (2008) considers that at least half of the most frequent 3,000 words of English are present as loanwords in Japanese in some form or other, and that speakers of Japanese know these loanwords. This means that a Japanese speaker sitting a vocabulary-size test may get several answers correct not on the basis of their knowledge of English but on the basis of their knowledge of English loanwords in Japanese. It seems perfectly reasonable to give credit for this knowledge, but it does not represent knowledge that has been learned through the medium of English. Japanese is not unusual in this respect, as most languages contain many loanwords from English. This is also common with languages like Spanish and English, which share cognates from Latin. Cobb (2000) found that French speakers scored well on the cognates in the vocabulary-levels test but poorly on the non-cognates.

Vocabulary-Size Goals

There are several ways of setting vocabulary-size goals for learners of English. One way is to set all the words of English as a goal. This is clearly unreasonable as even native speakers of English do not know all the words in English. A more reasonable goal would be to see the vocabulary size of native speakers as a goal. This is a rather daunting goal given the different conditions under which English is learned as a foreign language. A third goal is to see what vocabulary knowledge is needed to perform certain tasks (Nation, 2006). Table 1 indicates the vocabulary sizes needed to gain 98% coverage of the running words in a variety of text types. The figure of 98% has been chosen for two reasons. First, there is a piece of research which supports this figure as the text coverage which is needed for most learners to gain reasonable comprehension of a text (Hu & Nation, 2000). Second, 98% coverage represents one unknown word in every 50, which is about one unknown word in every five lines and about six unknown words per page. Although this is still quite a heavy vocabulary load, it is probably manageable.

Table 1 Vocabulary sizes needed to get 98% coverage (including proper nouns) of various kinds of texts

<i>Texts</i>	<i>98% coverage</i>	<i>Proper nouns</i>
Novels	9,000 word families	1–2%
Newspapers	8,000 word families	5–6%
Children's movies	6,000 word families	1.5%
Spoken English	7,000 word families	1.3%

As Table 1 shows, a vocabulary size of between 6,000 and 9,000 word families is needed to gain 98% coverage of a variety of texts. These coverage figures assume that proper nouns and transparent compounds can be considered as words that do not need to be known before a text is read or heard, and thus the percentage coverage figures include coverage by proper nouns and transparent compounds.

The Vocabulary Sizes of Second and Foreign-Language Learners

Vocabulary-size measurement is dependent on the type of test items used. Milton (2009, pp. 82–3), using a yes/no test, presents evidence of EFL-vocabulary growth rates of around 500 word families per year for Greek learners of English. There is, however, considerable variation between individuals, with the best students approaching rates of around 1,000 words per year. When learning rate is standardized by working out words per class-contact hour, the rates for recent studies of vocabulary size come out at around 4–5 words per hour for European learners of English (Milton, 2009, p. 88). This means that learners who have been studying English for six or seven years will have vocabulary sizes of around 3,000 words.

Nurweni and Read (1999) looked at the vocabulary size of Indonesian university students. They used three tests: a recall translation test, which is a more demanding measure than a yes/no test, an interview test, and a word-associates test. They found vocabulary sizes of around 1,200 words.

Receptive and Productive Vocabulary Size

Learners' receptive vocabulary size is typically larger than their productive vocabulary size. There seems to be no regular relationship between receptive vocabulary size and productive vocabulary size (Waring, 1997). This relationship will depend on the conditions under which vocabulary is learned. In countries where English is learned as a foreign language, with little chance of using it outside the classroom and where much of the learning is deliberate, there is likely not to be a big gap between receptive and productive vocabulary sizes. Where English is learned as a second language, however, there is likely to be a large gap between receptive and productive vocabulary size (Laufer & Paribakht, 1998).

Now that many of the methodological issues are better understood, and tests are readily available, it is likely that there will be a growth in studies of vocabulary size. Some vocabulary-size measures are now available in bilingual formats. That is, the test words and their sentence contexts are presented in the second language, and the choices are given

4 VOCABULARY SIZE IN A SECOND LANGUAGE

in the first language of the subjects. Such bilingual tests are likely to be more valid measures of vocabulary size than their monolingual counterparts. This is because bilingual tests remove the difficulty of understanding the difficult grammar of L2 definitions. Unpublished research indicates that the scores of lower-proficiency learners will be about 10% higher on bilingual tests than on the corresponding monolingual version. For advanced learners of English, the scores on the two versions will be about the same.

Voice Quality

JOHN H. ESLING

Voice quality refers to the long-term phonetic characteristics of a person's accent, although the term is also used in a narrower sense for the type of phonation produced in the larynx. In either case, the sound generated at the glottis, principally by the vocal folds, is considered the source or the first element that shapes a person's speech. When we recognize a person by the sound of their voice, voice quality in the broader sense is generally what we mean. We are responding to speech cues generated throughout the vocal tract that are the most persistent, habitual, or long lasting. They can be perceived in short portions of speech precisely because they are properties incorporated to varying degrees in all the rapidly changing short-term vowels and consonants that make up the segmental level of speech. Research on voice quality and discussions of second language teaching methods can be found in Acton (1984), Pennington and Richards (1986), Avery and Ehrlich (1987), Morley (1991), Murphy (1991), Dauer (1992), Esling (1994), Anderson-Hsieh (1995), Derwing and Munro (2005), and Levis (2005).

Narrow Definition

Voice quality in its narrower sense is taken to refer only to the laryngeal source. Usually this means the quality of phonation produced by the vocal folds at the glottis. However, the source should not be restricted to the glottal level alone. There are three sets of folds that can contribute to periodic vibration within the laryngeal mechanism: the vocal folds, the ventricular folds, and the aryepiglottic folds (Esling, 2005). These physiological mechanisms are reflected in Figure 1. The vocal folds are the most efficient source of voicing, but the ventricular folds can add to the aerodynamic/mechanical action of vocal-fold vibration, as in harsh types of phonation (Edmondson & Esling, 2006) or in some Tibetan chanting or throat-singing styles (Fuks, Hammarberg, & Sundberg, 1998). The third level of stricture in the larynx—the aryepiglottic folds—represents the sphincteric pursing of the top of the epilaryngeal tube. It is the place of articulation at which pharyngeals are produced. Sounds labeled as epiglottals are also appropriately localized to this place of articulation, since the aryepiglottic folds are the active articulators and the epiglottis is the passive articulator. Periodic signals are generated by the action of this “laryngeal constrictor” mechanism when the aryepiglottic folds trill (vibrate) against the epiglottis (Moisik, 2008). All three levels of laryngeal folds generate periodic signals that are often referred to as voice quality in the sense of source vibrations.

Broad Definition

In the broad sense of voice quality, the signal originating in the larynx constitutes the phonation type that is the background heard throughout most sounds that a speaker produces. The laryngeal source signal is then modified through the shapes created by the positions of the articulators through the larynx and in the upper vocal tract, producing characteristic resonances. These spectral resonances are more telling when the source is

2 VOICE QUALITY

Note. C, cricoid cartilage; Th, thyroid cartilage; VF, vocal folds; A, arytenoid cartilages; AE, aryepiglottic folds; H, hyoid bone; E, epiglottis; U, uvula; T, tongue. The ventricular folds are located within the epilaryngeal tube, just above the vocal folds and well beneath the aryepiglottic folds. The nasal tract (above the oral tract) is not depicted here.

voiced (periodic) rather than voiceless; but laryngeally voiceless sounds also have spectral energies associated with them as a result of turbulence (friction/noise) produced through the vocal tract.

Voice quality refers to the habitual, long-term background characteristics perceived as most constant or persistent over time in a person's speech. Perceptually, it is the longest-term strand of the aural medium for language. The other two strands—the voice dynamics strand and the segmental strand—are each progressively shorter term. Segments (vowels and consonants) last for only milliseconds; voice dynamics (e.g., intonation) features can occur over a stretch of syllables or words; while voice quality features persist quasi-permanently (Abercrombie, 1967) throughout the stream of speech. These features can be acquired characteristics shared as part of a person's regional or social upbringing, or they may be idiosyncratic traits. In assessing the voice quality common to a regional or social group, it is the identification of those voice quality features that are preponderant within a sociolinguistic sample of speakers that determines to what degree they are shared or idiosyncratic (Laver & Trudgill, 1979).

Henry Sweet at Oxford, one basis for Professor Higgins in G. Bernard Shaw's *Pygmalion* (see *My Fair Lady*), used the term "organic basis" (1890) to refer to the long-term quality specific to a given language. Paul Passy and Daniel Jones fostered this view of the indexical nature of accent, inspiring Honikman at University College London to explore "articulatory settings" in the accents of various language groups (1964). Popular "impressionistic" labels

for voice quality are distinguished from descriptive phonetic labels that have articulatory phonetic referents (Laver, 1980) and that can be used systematically and reliably because of the general phonetic principle that the normal human vocal tract generates predictable auditory and acoustic consequences when specific articulatory postures are assumed. The realizations of long-term phonation type and of long-term articulatory setting are referred to as an individual's "voice quality settings."

Voice Quality Features

Phonatory laryngeal features include the distinction between *breath*, which generates noise through friction, and *voice*, which generates a vibratory periodic signal. This fundamental distinction was described by Wilkins in the 17th century (1668), where *breath* was associated with *mute* consonants and voicing with *sonorous* consonants (cf. the French usage *sourde* vs. *sonore*). The terminology remains useful, because even 20th-century phonetic descriptions sometimes use the term *voicelessness* for *breath*—only one of a number of voiceless states of the glottis. Another voiceless state of the glottis—*whisper*—resembles *breath* at the level of the glottis but generates more friction due to laryngeal constriction of the epilaryngeal tube above the glottis. The only difference in the use of these terms for describing voice quality features rather than consonantal features is the longer cumulative time over which a voice quality feature persists.

If a speaker's voicing is phonetically neutral—with no otherwise distinguishing traits—it is described as *modal voice* (see Hollien, 1972; Laver, 1980). Adding increased laryngeal constriction to the voiced components of speech alters the quality of phonation in two ways. Either the voicing takes on the phonatory characteristics of *harsh voice* or the pitch of phonation lowers to what is termed *creaky voice*, or both could occur. Both effects can be termed "laryngealization." Voiced phonation can also take on breathy or whispery characteristics. *Breathy voice* is the state where voicing occurs at the anterior end of the glottis while air is escaping at the wider posterior end of the glottis. In laryngeally constricted mode, the parallel state of *whispery voice* would have the same glottal characteristics as *breathy voice* but with a narrowed epilaryngeal tube over the top of the glottis creating greater turbulent friction or noise. Thus, a voice might be encountered that realizes voiceless segments as *breath* and voiced segments as *breathy voice*—or voiceless segments as *whisper* and voiced segments as *whispery voice*. Varying amounts of *whisperiness*, *harshness*, and *creakiness* can be combined—to a slight, moderate, or extreme degree. All three elements of *harsh whispery creaky voice* are the product of constriction of the supraglottic laryngeal mechanism. By contrast, breathiness reflects an open laryngeal posture. Stretching the glottis in the antero-posterior plane (opposite to low-pitched *creaky voice*) alters the voice component toward the high-pitched *falsetto* end of the pitch continuum. The same auditory qualities that occur during constriction can also be realized (although not necessarily by the same articulatory mechanisms) at high pitch as degrees of *harsh whispery creaky falsetto*. This underlines the principle that voice quality features have auditory correlates whose use is learned through the consensual use of an agreed descriptive taxonomy.

Harshness is a complex quality that interacts with pitch in unique ways. As a function of the supraglottic laryngeal constrictor, a *harsh* voice quality is perceived when voicing becomes irregular or aperiodic ("jitter" in acoustic terms) as the vocal folds and ventricular folds are compressed in a narrowing supraglottic space by the overarching tightening of the aryepiglottic folds. When pitch is low (i.e., when there is antero-posterior shortening in the laryngeal system), the aryepiglottic folds themselves can be induced to vibrate. This quality occurs in growling, which has been referred to as *harsh voice (low pitch)*. *Harsh voice (mid pitch)* has less likelihood of aryepiglottic-fold trilling, as the laryngeal structures are

not as loose as when the glottal length is shortened. When the glottal length is increased, as for *falsetto*, but tight supraglottic laryngeal constriction is maintained, the stretching mechanism and the constriction mechanism create an isometric tension that is effective at keeping the glottis closed unless a more forceful airstream is used to drive phonation. This has been termed *harsh voice* (*high pitch*). The quality is strained, often called *pressed voice* in speech-science contexts, and resembles articulatorily a glottal stop with air being forced through it. The quality is auditorily characteristic of phonating during heavy lifting. Although referred to as *ventricular voice* in Laver (1980), other more purely ventricular modes have been described (Fuks et al., 1998).

Aside from what can be called phonatory effects, the laryngeal constrictor mechanism generates resonances through changes in pharyngeal volumes that have distinctive auditory correlates. *Raised larynx voice* is the archetypal quality resulting from a shortened pharyngeal volume due to aryepiglottic constriction, tongue retraction, and larynx raising. This quality is the fundamental setting of “Kermit the Frog” voice. Pitch needs to be high in order for this auditory quality to be achieved. Otherwise, if pitch is low, the same constricted posture of the laryngeal/pharyngeal articulators generates what is termed *pharyngealized voice*. The muscles used to sustain both voice qualities—the suprahyoid group—are the same muscles used in swallowing, which involves lifting the hyoid bone and tongue up and forwards and then backwards as the aryepiglottic sphincter constricts (using intrinsic laryngeal muscles), the tongue retracts, and the larynx raises to protect the airway. To stretch and relax these muscles, the opposite set of infrahyoid muscles contract to lower the larynx. This is what happens in a yawn; and the quality generated is called *lowered larynx voice*. Pitch must be low in order for this auditory quality to be identified. Otherwise, if pitch is high, the same stretched/lowered posture of the laryngeal/pharyngeal articulators produces what is termed *faucalized voice* (Esling, Heap, Snell, & Dickson, 1994). The articulatory configurations that generate these resonances predispose different phonatory effects. The raised larynx setting predisposes narrowed-tube whisperiness or harshness effects such as aryepiglottic trilling. The lowered larynx setting predisposes opening of the airway and breathiness; hence its correlation with yawning.

At the right angle of the vocal tract (Figure 1), the laryngeal articulator ends, the oral articulator begins, and the nasal tract also branches off. Behind the uvula, an open velo-pharyngeal port couples the nasal tract to the other resonators, generating the quality *nasal voice*. Nasal resonance differs from laryngeal and oral articulatory adjustments since the shape of the nasal cavity does not change articulatorily; however, the degree of nasality is influenced by the size of the velo-pharyngeal opening. The quality of nasal resonance has been thought of forensically as a useful marker of individual identity—as more anatomically derived than other features that are the consequences of social accommodation; but the degree of acquired nasality (velo-pharyngeal opening) is under a speaker’s control and remains a powerful indicator of social or regional background.

The tongue is the principal oral articulator. Its temporal interaction with the movements of the jaw and the lips defines most segmental sounds along the parameters of place and manner of articulation. The long-term postures of these articulators are the salient accompaniments to the segmental stream of speech that provide the background noise and resonances perceived as voice quality settings. While the tongue retracts as a reflexive complement to laryngeally constricted sounds, the tongue raises (upwards and posteriorly) to produce uvularized or velarized sounds. Persistent raising of the tongue where the lingual dorsum habitually approximates or returns to the soft palate yields *uvularized voice* or *velarized voice*. Such lingual postures play a role in *denasal voice* as well, which is an interesting combination of raising and nasality, juxtaposed with the denasalization of segments that are normally nasal. This is a good example of how long-term voice quality can be defined by its interaction with the segmental strand of speech.

Palatalized voice results from the fronting of the body of the tongue, with the tongue tip still depressed behind the lower teeth. *Palato-alveolarized voice* is the most extremely fronted quality with this type of lingual posture. When the tongue tip is extended to move forwards, *alveolarized voice* or *dentalized voice* results. These places of articulation are most efficiently employed to make segmental contrasts, precisely because of their rapid execution. But a persistent fronting of the tongue tip onto or through the teeth gives a distinct long-term percept of dentalization. The sustained orientation of the tongue tip has given rise to the categories *tongue tip articulation*, *tongue blade articulation*, and *retroflex articulation*, the latter being the most distinct articulatorily and auditorily. Tongue-fronted, tongue-raised, and tongue-retracted movements of the tongue body delineate salient extremes in their effect on consonants and vowels.

Jaw posture has a noticeable impact on voice quality perception. *Close jaw* contrasts with *open jaw*; and *labiodentalized voice* (mandibular retraction) contrasts with *protruded jaw voice* (mandibular protrusion). Labial postures are visually as well as auditorily salient in voice quality perception. *Close rounded voice*, *open rounded voice* (which also implies jaw opening), and *spread lip voice* are maximally distinctive. Articulatory rounding or protruding of the lips lengthens the vocal tract, and labial spreading shortens the vocal tract, with predictable acoustic/auditory effects. Saying a phrase or counting “one, two, three, four, five . . .” with close rounding versus spreading demonstrates the scale of the effect.

Voice Quality in a Second Language

Because voice quality is physiologically based, it can persist in a speaker’s voice whatever language they are speaking. We can detect if a person has a cold or laryngitis from the long-term effects on their voice. Because voice quality is also socially indexical, multilingual speakers can switch settings between languages or exhibit combined features drawn from each language. Flemish–French bilinguals (Harmegnies & Landercy, 1985) and Catalan–Spanish bilinguals (Bruyninckx, Harmegnies, Llisterri, & Poch, 1994) demonstrate acquired long-term characteristics of the language they are speaking, due primarily to the cumulative weighting of language-specific phonological features over time as well as individually marked traits of their own voices. Within a linguistic community, particular voice quality settings (as well as dynamic and segmental features) are indexical of particular regions or social affiliations. Tongue raising (backing) as a habitual secondary articulation in many Yorkshire or Lancashire accents or nasal and breathy voice quality in Glasgow accents are salient examples (see Foulkes & Docherty, 1999). Social class is marked by preferences for particular settings, but a given feature, for example nasal voice, may occur in accents with more social prestige as well as in other accents with less social prestige.

Paralinguistically, “register shifts” in setting over short periods of time may reflect a speaker’s personality or changing emotional states. Within a given culture, prototypes can be established by evaluating listeners’ perceptual responses to character portrayals by professional voice actors (Teshigawara, 2003). Such long-term prototypical elements have been used as a guide in the teaching of pronunciation (Esling & Wong, 1983). The principle is that altering the long-term settings of the articulators to those of the target language can globally encompass a number of phonological tendencies, making it easier to “reach” the segmental features of the target language. Practical techniques for increasing student awareness of voice quality differences and for experimenting with the voice have been proposed (Jones & Evans, 1995). Language attitudes, and even the desire to modify one’s own accent when learning a second language, may be dependent on identities and feelings of self-esteem signaled by differences in voice quality settings.

Vygotsky and Second Language Acquisition

HOLBROOK MAHN

The far-reaching influence that the Russian psychologist Lev Vygotsky (1896–1934) has had on second language acquisition (SLA) research is reflected in studies which emphasize the important role played by semiotic mediation in social interaction within social, cultural, physical, and historical contexts. While Vygotsky did not write extensively about SLA per se, he did provide a foundation for SLA research through his analysis of the development of mental systems as humans acquire and develop the ability to communicate through language. His study of the interrelationship between *thinking processes*, those involved in perceiving, processing, organizing, and storing information from the environment and using it to guide action, and *language processes*, those involved in using signs/symbols to make and communicate meaning in social interaction, provides a foundation for understanding the interrelationship between thinking and language processes involved in communicating meaning in a second language.

The system of meaning created by the unification of thinking and language processes was at the center of Vygotsky's work and constitutes the foundation upon which rise the concepts for which he is best known, including the zone of proximal development, social interaction, sign/symbol use to mediate activity and the consequent development of higher psychological processes, inner and private speech, play, and the role of the social/cultural/historical situation of development. Many researchers use these concepts to guide their investigations into aspects of second language development. Not as well known is the fact that Vygotsky used the concept *system of meaning* to study the development of the human psyche by analyzing higher psychical processes such as logical memory, voluntary attention, and verbal perception in relationship to language use and development. Analyzing mental systems to reveal the origins and development of human consciousness was the central focus for Vygotsky's decade-long research. He conceived of consciousness as a system of systems, and began his investigation of consciousness by analyzing the system of meaning created through the unification of thinking and language processes. In spite of its centrality, the system of meaning has not been widely explored in second language research informed by sociocultural theory, or in sociocultural studies in general. This entry describes Vygotsky's analysis of the system that results from and in turn develops language use, and then describes how this analysis illuminates the processes involved in SLA and development.

Internal System of Meaning

A fundamental concept for sociocultural studies is the role signs/symbols play in the mediation of human activity. "Vygotsky's fundamental theoretical insight is that the higher forms of human mental activity are always and everywhere *mediated* by symbolic means" (Lantolf, 1994, p. 418). Vygotsky acknowledged that mediation was central to his theoretical analysis, but at a meeting with his closest collaborators near the end of his life, he reiterated that the focus of their work was not mediation in and of itself but rather the

internal system of meaning created through mediated social interaction. He acknowledged their focus on sign and sign operations in earlier investigations, but added “we ignored that the sign has meaning” (Vygotsky, 1997a, p. 130) and consequently they did not study the development of meaning. “We proceeded from the principle of the constancy of meaning, we discounted meaning” (1997a, p. 133). He noted that linguistic and psychological theories of his time took the development of meaning for granted, viewing it as stable and unchanging. In those theories the constancy of meaning is “given as the starting point which terminates the process as well” (p. 132) and therefore the origins and the course of development of meaning are ignored. In that same meeting Vygotsky clarified his conception of *meaning*:

Meaning is not the sum of all the psychological operations which stand behind the word. Meaning is something more specific—it is the internal structure of the sign operation. It is what is lying between the thought and the word. Meaning is not equal to the word, not equal to the thought. (Vygotsky, 1997a, p. 133)

Focusing on the systemic nature of consciousness, Vygotsky looked at the development of meaning as a process, one that is shaped by its relationship with other psychological functions, processes, structures, and systems. The system of meaning is part of larger systems—the human psyche and human consciousness—and therefore, “The structure of meaning is determined by the systemic structure of consciousness” (1997a, p. 137). Unlike other psychologists of his time who examined mental entities by isolating them in their external manifestations or by conceptualizing them separately from other mental entities, Vygotsky analyzed “the systemic relationships and connections between the child’s separate mental functions in development” (1987, p. 323) and conceived of the relationships between functions as constituting “a *psychological system*” (1997a, p. 92).

In addition to conceptualizing the system of meaning created through the sign operation as a psychological system, Vygotsky recognized other systems of meaning based on mathematics, music, art, aesthetic response, and volition and affect, among others. Because his main focus was on the system that results from the unification of language and thinking processes, “system of meaning” in this entry refers to that particular system. In describing the system of meaning, rather than focusing on secondary sources, this entry draws on Vygotsky’s writings, particularly those which explain: his methodological approach; his analysis of predominant theories about the relationship of thinking and speaking; his phylogenetic analysis of the development of thinking and speaking; his examination of the structure of generalization; his description of the development of a system of concepts; and his analysis of times of qualitative transformation in a child’s development, including the development of higher psychological processes, periods of crisis, and the development of conceptual thinking.

In his use of the concept *mental system* Vygotsky emphasized that the relationships among mental functions determine the character of the system. The functions in and of themselves might not qualitatively change, but the relationships among them go through transformations leading to different stages of development. “Such functions as voluntary attention, logical memory, higher forms of perception and movement, which thus far have been studied in isolation, as separate psychological facts, now, in the light of our experiments, appear essentially as phenomena of one order—united in their genesis and in their psychological structure” (Vygotsky, 1999, p. 38). These functions are “internally connected with the development of the symbolic activity of the child” (p. 39).

Vygotsky saw a dialectical relationship between language and thinking processes, with each process shaping and being shaped by the other in an internal mental system that resulted from their unification. Vygotsky (1987) devoted most of his final work, *Thinking*

and *Speech*, to describing investigations into the origins and nature of this unification and the new entity, verbal thinking, created by thinking and language processes. In examining the processes through which both the human species and individuals create internal mental systems as they develop the ability to receive and produce signs to communicate meaning, he made the analysis of the origins and nature of verbal thinking the central focus of his investigations. He conceived of mental activity as a process that is organized as a system with other systems, in the development of which there are times of qualitative change during which fundamental, essential transformations in verbal thinking and its relationship to other mental functions occur. The stage that individuals have reached in the development of their systems of meaning will influence their SLA and development.

Methodological Approach

The methodological approach Vygotsky developed to study the relationships between thinking and speaking processes can also help inform investigations into the processes involved in acquiring and developing communicative capacity in a second language. To find the essence of the unification of thinking and language processes Vygotsky sought an aspect of this unification that was primary, basic, irreducible, essential, and yet still maintained the essence of verbal thinking, the whole being investigated. "What then is a unit that possesses the characteristics inherent to the integral phenomenon verbal thinking and that cannot be further decomposed? In our view, such a unit can be found in the inner aspect of the word, its meaning [*znachenie slova*]" (1987, p. 47). In his investigation of *znachenie slova*, Vygotsky examined the social origins of the ability for both the human species and individual to use language to communicate, as well as analyzing the origins and development of the internal mental systems that are necessary for and result from this communicative ability.

Because of the way *znachenie slova* has been translated into English, Vygotsky's investigation of it is often not addressed in interpretations of his work. The Russian *znachenie* translates as "meaning" and *slova* as "word," but Vygotsky made clear that he was using *slova* as a synecdoche (Kozulin, 1990, p. 151) to refer to language use as a whole, as in "in the beginning was the word" (Vygotsky, 1987, p. 284). Because *znachenie slova* is translated into English as *word meaning*, the focus in interpretations of Vygotsky's work has generally been on the meaning of words, on the external use and relationships of words, and on the role of words in semiotic mediation; this causes the role of thinking processes to be overlooked. Consequently, the concepts of the internal *system of meaning* and *znachenie slova* that Vygotsky held central to his theoretical framework, and that provided a focus for his research, have been neglected.

In *Thinking and Speech* Vygotsky analyzes *znachenie slova* from three perspectives: genetically—its origins; structurally—the development of and interconnection to psychological functions and processes related to it; and functionally—its psychological activity and motivating factors. Through this analysis, Vygotsky is able to "disclose the internal essence that lies behind the external appearance of the process, its nature, its genesis" (1997b, p. 70). This was an important part of Vygotsky's approach to second language studies as well. In his article "The Question of Multilingual Children" (1997b, pp. 253–9) Vygotsky writes that in setting up studies on the bilingual child a prerequisite is "to descend from the surface, from taking into account external traits and indicators, and to penetrate deeply, to take into account internal structures of the processes that are directly involved in the speech development of the child" (p. 257).

Vygotsky examined the origins of *znachenie slova* in an individual as a *process* that has its foundation in the infant's physical brain and in the elementary thinking processes with

which humans are born and which develop in infancy, such as mechanical memory, involuntary attention, and perception. These elementary mental functions are shaped by the sociocultural situation of development into which children are born and by their social interactions in those situations. An infant's developing perception, attention, and memory lead to communication between the child and caregivers, with the latter ascribing communicative intent to the infant's gestures and sounds. Through this early social interaction children develop communicative intentionality and the initial use of symbols to convey meaning—key elements in the acquisition of language. A qualitative transformation in social interaction takes place as communication of meaning is accomplished through signs and the development of language use, and through the ability to generalize in "the creation and the use of signs" (Vygotsky, 1997b, p. 55).

It turns out that just as social interaction is impossible without signs, it is also impossible without meaning. To communicate an experience of some other content of consciousness to another person, it must be related to a class or group of phenomena. As we have pointed out, this requires *generalization*. *Social interaction presupposes generalization and the development of verbal meaning*; generalization becomes possible only with the development of social interaction. (Vygotsky, 1987, p. 48)

Two basic functions of speech, reflection of reality in a generalized way and communicative social interaction, are important components of the system of meaning and thus of verbal thinking. The ability to generalize, which is developed through play and communicative social interaction, is manifest internally in the structure of generalization that a child develops, a structure that provides the foundation for the system of meaning. In *Thinking and Speech*, Vygotsky (1987) describes the development of this structure of generalization as the child acquires language, focusing on the different modes of thinking that create "the formation of connections, the establishment of relationships among different concrete impressions, the unification and generalization of separate objects, and the ordering and the systematization of the whole of the child's experience" (p. 135). Vygotsky emphasizes the processes necessary to acquire these modes of thinking—voluntary attention, partitioning, comparison, analysis, abstraction, and synthesis—essential for the development of verbal thinking and the structure of generalization.

In his analysis of the development of conceptual thinking, Vygotsky focuses on the origins and development of the *pseudo-concept*, which occurs when a child and an adult both focus on an object designated by a word, and in that shared interactive contact they are able to communicate; however, they use different forms of thinking to arrive at the point where they are using the same word for an object. "The child thinks the same content differently, in another mode, and through different intellectual operations" (1987, p. 152). The child and the adult have different modes of thought as the foundation for their systems of meaning. "The child and adult understand each other with the pronunciation of the word 'dog' because they relate the word to the same object, because they have the same concrete content in mind. However, one thinks of the concrete complex 'dog' [the pseudo-concept] and the other of the abstract concept 'dog'" (p. 155).

Vygotsky claims that children develop their own *sense* of a word as it is internalized, with sense both developing and being developed by the system of meaning. Sense (*smysl*) is an important component in the system of meaning, with the more stable lexical meaning as an essential but subordinate part of sense. "In inner speech, we find a predominance of the word's sense over its meaning" (1987, p. 274). Vygotsky describes the process of social interaction through which meaning is internalized into an individual's sense with "the meaning of the word in inner speech as an individual meaning, a meaning understandable only in the plane of inner speech" (p. 279). There are always going to be degrees

of divergence among meanings that have developed in a particular social setting and the *sense* of words or concepts incorporated into an individual's system of meaning. Vygotsky explains that "[t]o some extent, [sense] is unique for each consciousness and for a single consciousness in varied circumstances" (p. 276). The sense of a word is never complete, but evolves with the system of meaning of which it is a part through activity in the social situation of development. Sense as "the aggregate of all the psychological facts that arise in our consciousness as the result of the word" (pp. 275–6) is a key component in the system of meaning. "Ultimately, the word's real sense is determined by everything in consciousness which is related to what the word expresses . . . [and] ultimately sense depends on one's understanding of the world as a whole and on the internal structure of personality" (p. 276).

Connected to an individual's system of meaning is an individual's *system of concepts*. The generalization and abstraction needed to acquire conceptual thinking can only be accomplished through the process of developing a *system of concepts*, concepts that are introduced externally, primarily through school, concepts that are organized into systems and interconnected with multiple other systems—what Vygotsky refers to as scientific concepts. These are internalized in a system of concepts, which becomes similar to the system of meaning during this transition from complexive to conceptual thinking. "[P]sychologically, the development of concepts and the development of *znachenie slova* are one and the same process" (1987, p. 180). Recognizing that the development of meaning and concepts takes place through the interrelationships of systems within systems, and understanding where a student is in that process, are important for teachers, whether working with school-aged or with adult second language learners. The recognition that an adult learner has developed a system of meaning in their native language as described above by Vygotsky is an important initial step when working with adults learning a second language.

Vygotsky, SLA, and Development

Vygotsky argues that learning a second language "must be studied in all its breadth and in all its depth as it affects the whole mental development of the child's personality taken as a whole" (1997b, p. 259). Studies of second language learners must take "into account the whole aggregate of social factors of the child's intellectual development," and must use the genetic method both to trace this development "with all of its multifaceted qualities" (p. 257) and to explore the complexity of this process, which depends "on the age of the children, on the nature of the meeting of the one language with the other and finally, what is most important, on the pedagogical effect on the development of the native and the foreign language" (p. 257). His aim was "to take into account internal structures of the processes that are directly involved in speech development of the child" (p. 257). Even though he laid out key criteria for studying SLA, he did not conduct research in this area himself.

Vygotsky does use the processes involved in learning a second or a foreign language to draw an analogy with the processes involved in the development of concepts in systems, what he called *scientific concepts*, as both are marked by a level of conscious awareness not present in learning one's native language or acquiring everyday, spontaneous concepts. "The development of scientific concepts begins in the domain of conscious awareness and volition. It grows downward into the domain of the concrete, into the domain of personal experience" (1987, p. 220). Everyday concepts develop in the opposite direction, from the concrete to the more abstract, toward conscious awareness and volition. "Scientific concepts restructure and raise spontaneous concepts to a higher level, forming their zone of

proximal development" (p. 220). Vygotsky compares the relationship between the paths of development of concepts in systems (scientific) and of spontaneous concepts with the relationship that exists between the acquisition of a native language and a second language:

The child learns a foreign language in school differently than he learns his native language. He does not begin learning his native language with the study of the alphabet, with reading and writing, with the conscious and intentional construction of phrases, with the definition of words, or with the study of grammar. Generally, however, this is all characteristic of the child's first steps in learning a foreign language. The child learns his native language without conscious awareness or intention; he learns a foreign language with conscious awareness and intention. (1987, p. 221)

The level of conscious awareness that children have of their own thinking processes will affect their acquisition of a second language. In drawing a comparison between learning to write and learning a second language, Vygotsky argues that both processes involve a level of conscious awareness that is not present when children learn their native language. When they enter school, children begin to develop a conscious awareness of their attention and memory, but they do not have a conscious awareness of their own thinking processes, an ability that they acquire in adolescence. Where children are in the process of development of their internal systems of meaning is related to the level of conscious awareness they have developed.

Vygotsky outlines a number of other differences between the processes of learning a native language and learning a foreign language including affective and emotional concerns, and concludes by stating, "The child already possesses a system of meanings in the native language when he begins to learn a foreign language. This system of meanings is transferred to the foreign language" (1987, p. 221). He acknowledges that children who acquire two languages from infancy develop two relatively distinct systems of meaning through each language. Citing a study by Ronget, he states, "The result of the experiment showed that the child acquired both languages in parallel and almost completely independently of each other" (1997b, p. 255).

Vygotsky's writings on the development of the system of meaning, and the concomitant formation of concepts, are useful in looking at second language learners. In analyzing both, he examines ways in which changes in internal relationships between mental processes also affect children's experiences of their sociocultural environment and the meaning that they make of these experiences. He calls this experience of *meaning* "one of the most complex problems of contemporary psychology and psychopathology of the personality" (1998, p. 290). Understanding the nature of the structure of generalization is key to the development of meaning. "Thus, in concept development, the movement from the general to the specific or from the specific to the general is different for each stage in the development of meaning depending on the structure of generalization dominant at that stage" (1987, p. 226). Understanding where children are in their concept development can help in understanding their processes of acquiring a second language.

Conclusion

The fundamental concept that all mental activity is part of an interconnected system of systems is central to all of Vygotsky's work. In approaching second language research, he stressed the importance of studying the interconnectedness of the processes of SLA with processes involved with acquiring one's native language and with the processes at play in the development of the human brain/mind unity—the development of the human

psyche. Although he did not write about SLA extensively, he did provide a theoretical framework and a methodological approach to guide research into SLA. Unfortunately, an essential aspect of Vygotsky's theoretical framework—the system of meaning that is created through the unification of thinking processes and language processes—has often been overlooked by researchers who rely on his work.

Mahn (2008) gives an overview of this essential concept, *znachenie slova*, that provided the focus for Vygotsky's investigation of the relationships between thinking and language use in the development of human consciousness. Without exploring the essence of Vygotsky's work—meaning as a system within systems in the “thinking body”—there has been a tendency in SLA research to extrapolate a concept of Vygotsky's from his overall theoretical framework and use it to study some aspect of human development. This isolation is problematic because it leads to overlooking an essential aspect of his work: his investigation of human development as a system within dynamic, physical, social, cultural, natural, and historical systems at the center of which are the processes and interactions through which language is acquired and a system of meaning is created.

Vygotsky continually emphasized the need to go beyond appearance, beyond the surface manifestations of a phenomenon, and to look at its interconnectedness with other systems and its process of development from its beginnings to its end. That advice aptly applies to the study of his work. In critiquing Vygotsky's theoretical framework, sociocultural researchers have often relied more heavily on interpretations of his work than on his actual writings. Understanding his central concepts is essential if his theoretical framework is used to guide investigations of SLA, and can best be achieved by reading Vygotsky's major work, *Thinking and Speech*, in its most complete form (1987) (translation issues notwithstanding) rather than abridgments of that work (1962, 1986). His work is complex and challenging, but his theoretical framework and the methodological approach that constructs it can make a significant contribution to the analysis of language acquisition and its role in the development of the human mind/psyche.

Warschauer, Mark

SHANNON SAURO

Mark Warschauer (born 1954) is a US scholar and researcher, known for his work on technology in language and literacy education. His research explores the pedagogical applications of technology for second language (L2) learning, the social and educational dimensions and implications of digital literacy, and the use of technology to foster learning and empowerment. He has conducted research in the United States in elementary and secondary schools, and among adult learners in technology-enhanced learning contexts in several countries, including Egypt, the United States, and the Czech Republic.

Professional History and Influences

Warschauer completed his bachelor's degree in psychology in 1975 at the University of California at Santa Cruz, where his early interest in technology led him to take courses in information and computer science. He went on to earn California teaching certification in mathematics, social studies, English as a second language (ESL), and Spanish in 1979 as well as a master's degree in teaching ESL in 1991 at San Francisco State University. From 1977 to 1991, he held various teaching positions, primarily teaching ESL in elementary, middle, and high school contexts as well as in university and adult learner programs in California.

In 1993, Warschauer's initial interest in technology transformed into a passion and a primary research focus during a two-year Fulbright to the Czech Republic, where he first used the Internet at Charles University and began to envision its impact on language use, language learning, and language teacher education. In 1994, at the age of 40, he began his PhD in L2 acquisition at the University of Hawai'i at Manoa, where he also worked as a research assistant on issues related to language and technology through the National Foreign Language Research Center (NFLRC).

After completing his PhD in 1997, he continued working as a researcher in the College of Language, Linguistics, and Literature at the University of Hawai'i at Manoa until 1998, when he moved to Egypt to work as the director of educational technology for the American-Mideast Educational and Training Services/US Agency for International Development in Cairo for the next three years. In 2001, he returned to the United States to take up a faculty position at the University of California, Irvine. As of 2010, he is a professor in the Department of Education and the Department of Informatics at the University of California, Irvine, where he directs the graduate program for the PhD in education and serves as director of the Digital Learning Lab (<http://dll.gse.uci.edu/Index.html>).

Warschauer sees his early professional experience as a teacher and social activist, as well as the work he conducted while in Egypt from 1998 to 2001, as informing and broadening his perspective on electronic literacy to conceive of ways in which technology can be used to transform learners' lives. In particular, Warschauer credits Jim Cummings and James Gee with influencing his ability to make theoretical links between technology and language use, literacy practices, and social contexts.

Major Contributions

Warschauer's contributions to the field of applied linguistics can be best divided into three main areas, which have informed work in computer-assisted language learning (CALL), literacy, and equity and social inclusion of culturally and linguistically diverse populations through technology.

While still a doctoral student at the University of Hawai'i at Manoa, he established *Language Learning & Technology* (<http://llt.msu.edu>), the first online peer-review journal dedicated to research on computer-assisted language learning (Smith & Lafford, 2009), in 1997. One of the motivating factors behind the creation of this freely available online journal was to provide access to emerging scholars around the world, particularly in developing countries, who might not have had access to commercial publications.

During this time, some of his earliest research, which examined the use of technology for L2 development, was published. This included classroom-based investigations which compared qualities of learner language during computer-assisted class discussions (CACD) using synchronous computer-mediated communication (SCMC) with language produced during spoken discussions (Warschauer, 1996), as well as guidelines for educators on the use of technology applications to support L2 learning (see, e.g., Warschauer, 1997, for the use of computer-mediated communication [CMC] in collaborative learning; Warschauer & Whittaker, 1997, for guidelines on Internet use for English-language instruction). This early work has proven foundational to the rapidly growing subfield of CALL that deals specifically with the use of networked-based SCMC for classroom language instruction (e.g., Warschauer & Kern, 2000) and for an increasing number of studies that incorporate SCMC to examine L2 acquisition processes.

The second major focus of Warschauer's research concerns the impact technology has on learners' literacy development and practices. In documenting the technology being used in networked classrooms and learners' own literacy practices and preferences outside the classroom, Warschauer has added to the field's understanding of how these new kinds of technology-driven literacy practices can have a positive or a detrimental impact on learning. For instance, in US public schools, Warschauer (2006) observed the type of instruction and writing generated in classrooms where children were given their own networked laptops for reading and writing instruction. In doing so, he found evidence of different computer-aided scaffolding techniques used by teachers to facilitate literacy development, a reliance on typed and not handwritten drafts of writing assignments, and students' use of shareware programs to foster writing collaboration and peer editing. In further case studies of individual learners and classrooms in laptop-supported schools, Warschauer and his colleagues have also documented learners' creation of hybrid or multimodal texts or multimedia projects, in which learners generated or transformed online texts, images, and other supporting material to summarize or reflect their understanding of course material (e.g., Warschauer, Grant, Del Real, & Rousseau, 2004; Ware & Warschauer, 2005).

However, Warschauer's work has also highlighted the trade-off in literacy development that can occur when minimally supervised or unstructured instructional technology is introduced into a community or educational context. This was evident in his exploration of the unanticipated literacy consequences of the "hole-in-the-wall" minimally invasive education experimental project in New Delhi, India, in 2000 (Warschauer, 2002). As part of this project, outdoor computer kiosks were set up in one of the poorest neighborhoods of New Delhi with the intention of fostering children's self-paced learning. While the children did indeed learn basic computer skills (e.g., copying and pasting, how to open common software applications), without teaching or adult guidance, or the availability of Hindi-language software, most of their computer time was spent playing games or painting

in Microsoft Paint. As an added unintended consequence, some parents perceived that the computer kiosks were distracting their children from spending time on actual schoolwork.

Recognizing the possibility for technology to serve as a tool for social and linguistic change, Warschauer has also been influential in examining the use and availability of technology to support social equity and inclusion among culturally and linguistically diverse populations. This is most evident in his work on the digital divide, including his 2003 book, *Technology and Social Inclusion: Rethinking the Digital Divide*, and case studies conducted on the digital divide in Egypt (Warschauer, 2003a) and among different populations within the United States (e.g., Warschauer, Knobel, & Stone, 2004). In this area, Warschauer has explored the physical, digital, and social resources necessary for successful access to information and communication technology (ICT) and how inequity of access compounds existing educational gaps among different learner populations (e.g., Warschauer, 2008; Warschauer & Matuchniak, 2010). His work, as a result, illustrates the significance of individual and social practices as well as the social and technical infrastructure necessary to transform education and literacy with technology.

In his work, Warschauer has been inspired by the commitment of those in the international community who have dedicated their time and resources to fostering learning and empowerment. He welcomes the opportunity to network with people around the world engaged in these issues and can be reached via e-mail (markw@uci.edu), or followed on his blog (<http://papyrusnews.com>) and on Twitter (<http://twitter.com/markwarschauer>).

Washback in Language Assessment

DIANNE WALL

“Washback” refers to the influence important tests have on classroom practices—in particular, the effects they have on teaching and learning. The term is commonly used in applied linguistics and language testing, though some researchers in these fields and most researchers in general educational research use the term “backwash” for the same phenomenon. “Impact” is sometimes used as a synonym to washback, but it also serves as a more general term, referring to “any of the effects a test may have on individuals, policies or practices, within the classroom, the school, the educational system, or society as a whole” (Wall, 1997, p. 291). Washback is the type of impact that appears in the classroom. The last 20 years have seen a growing awareness of the need to investigate washback, and to discover what factors affect its form and intensity.

Washback is said to be the result of “high-stakes tests.” Madaus (1988, p. 87) defines these as tests “whose results are seen—rightly or wrongly—by students, teachers, administrators, parents, or the general public, as being used to make important decisions that immediately and directly affect them.” High-stakes tests include tests that determine whether students can pass on to higher levels of education, graduate from university, or study abroad, and tests that are used for employment or migration purposes. Tests can be high-stakes for teachers and institutions as well as for test takers, especially if the teachers’ pay or progression through the profession are determined by test results, or if the institutions’ reputation or funding depends on their students’ outcomes. According to Swain (1985, p. 43), “if (teachers) know the content of a test and/or the format of a test, they will teach their students accordingly.” While it is natural that both students and teachers should aim for good results, focusing on test demands does not always lead to optimal teaching and learning. If the test accurately represents the aims of the curriculum, then teaching and studying for it may contribute to the achievement of these aims. This is known as “positive washback.” “Negative washback” can occur if the test does not match the aims of the curriculum. In Bachman and Palmer’s words “‘teaching to the test’ in this case implies doing something . . . that may not be compatible with teachers’ own values and goals, or with the values and goals of the instruction program” (2010, p. 108).

The washback phenomenon (without this label) has been discussed in educational research for many years (e.g., Vernon, 1956). Madaus (1988) was especially critical of the negative results of high-stakes testing, which included not only “teaching to the test,” but also the overuse of past exam papers, the adjustment of teaching methods to suit the form of test questions, and a general acceptance of test results “as the major goal of schooling rather than as a useful but fallible indicator of achievement.” Perhaps his starkest prediction was that “a high-stakes test transfers control over the curriculum to the agency which sets or controls the exam” (pp. 88–97). Frederiksen (1984) warned against “the real test bias”: that the use of cheap and easy-to-construct test methods such as multiple choice would lead to the teaching of factual knowledge rather than higher-level skills.

Popham (1987), in contrast, claimed that high-stakes testing could affect teaching and learning in a positive way, if the tests were “properly conceived and implemented” (p. 680). He argued that successful “measurement-driven instruction” depended not only on good test design but also on adequate support to teachers. Frederiksen and Collins

(1989) introduced the notion of “systemic validity,” where tests provoked changes in the educational system that would lead to the development of the higher-level skills the tests were meant to measure.

Serious discussions of washback did not occur in the applied linguistics or language testing literature until the early 1990s. The catalyst for such discussions was an article entitled “Does Washback Exist?,” which claimed that earlier references to washback in language testing were mainly assertions about its existence or expressions of faith that it would occur in situations where new or revised tests were being introduced. The authors, Alderson and Wall (1993), analyzed the notion of washback more thoroughly than had been done hitherto, suggesting through a series of “washback hypotheses” the sorts of areas that could be influenced by tests—for example, what teachers teach, how they teach, what learners learn, how they learn, the rate and sequence of teaching and learning, the degree and depth of teaching and learning, and attitudes toward the content or methods of teaching and learning. They argued that test developers should think carefully about the specific washback they intend to produce, and that researchers should be precise about what they are looking for when they set out to investigate whether washback has been created. Alderson and Wall also commented on the need to use multiple research methods, including classroom observation, when researching washback, and on the desirability of using ideas from disciplines outside language testing (educational research, innovation theory, motivation theory) when building frameworks for the study of washback.

Three further publications helped to establish the foundations for washback research in language testing. Hughes (1994) specified that tests could affect participants, processes, and products in the language-teaching context, and gave examples of each of these. Bailey (1996) combined the Alderson and Wall hypotheses and Hughes’s participants–processes–products distinction to produce a useful model of washback (p. 264). She also discussed methods of investigating the phenomenon, and proposed questions to help test producers and test users think about “the positive washback potential” of the tests they were dealing with. The questions covered areas such as the users’ understanding of the purposes of the test and the intended use of its results, the manner in which results are reported, the users’ perceptions of the fairness of the test, the correspondence between what the test measures and the goals of education, the theoretical underpinnings of the test, and the users’ investment in the assessment processes (pp. 276–7). Wall’s (1996, 2000) contribution lay in her use of innovation theory to explain why good test design is not a sufficient condition for producing positive test washback. Using data from a test reform project in Sri Lanka and building on ideas from educational innovation, she shows how factors such as the characteristics of the educational context before and after the launch of a new test, and the characteristics of the teachers and learners interact with the characteristics of the test and the curriculum it is based on. This interaction can produce washback that is quite different from what is intended by policy makers and test developers.

The first collection of washback studies was published in a special issue of *Language Testing* in 1996. The collection opened with Messick’s (1996) explanation of how washback is a specific instance of the consequential aspect of construct validity, and his view that positive washback can be facilitated through improvements in test design, in particular the elimination of construct underrepresentation and construct-irrelevant difficulty. Messick’s article was followed by Bailey’s (1996) review of the washback literature and the washback model referred to above. There followed four empirical studies, which have since become fundamental reading for those interested in research on washback. Alderson and Hamp-Lyons (1996) investigated the influence of the Test of English as a Foreign Language (TOEFL) on test preparation classes in the USA, and Watanabe (1996) the influence of university entrance examinations in preparation schools in Japan. Shohamy, Donitsa-Schmidt, and Ferman (1996) reported how washback changed over time in Israel,

and Wall investigated the effects of a new secondary school examination in Sri Lanka. All of the studies showed how washback was much more complex than early language testing handbooks such as Heaton (1990, p. 17: "If it is a good examination, it will have a useful effect on teaching; if bad, then it will have a damaging effect on teaching") had implied.

Cheng and Watanabe published a second collection of washback studies in 2004, which contained comprehensive reviews of the concept of washback, the types of research methods that had been used in washback studies, and the relationship between washback and curricular innovation. It also presented eight studies of washback, dealing with the effects of national and regional tests in six different settings (the USA, Australia, Japan, Hong Kong, China, and Israel), and the influence of the International English Language Testing Service (IELTS) on teaching materials and on test preparation classes in New Zealand. The collection provides not only an excellent update on the state of the field since the late 1990s but also a good sense of how sophisticated research questions and methods for investigating washback and other forms of impact have become since that time.

Spratt published a comprehensive review of washback studies in 2005, which aimed "to provide teachers with a clearer idea of the roles they can play and the decisions they can make concerning washback." She divided her review into five themes, which dealt with washback on the curriculum (content, timetabling, and class size), materials (test-related textbooks and past test papers), teaching methods, feelings and attitudes, and learning. She also categorized the many factors that have now been found to affect the form and intensity of washback: teacher-related factors (beliefs, attitudes, education, experience, and personalities), resources, school factors (atmosphere, learning traditions, and internal pressures), and factors relating to the test itself (the proximity of the test, the stakes, the format, the weighting of different sections).

The most recent collection of washback studies was published in a special issue of *Assessment in Education* in 2007. The issue contains studies from six different testing contexts, and addresses concerns such as the fairness of applying assessment measures that have been validated on L1 learners to L2 learners, whether mandated tests in primary schools provide useful information to parents, whether it is possible for high-stakes tests to encourage communicative teaching, and whether dedicated test preparation classes give students an advantage in raising their test scores. There are also discussions of the importance of understanding the educational context into which a new test will be introduced and the effect that contextual features can have on facilitating or hindering beneficial washback, and of the powerful role that tests can play in the hands of policy makers.

There is now a substantial literature on test washback and impact; however, in the words of Cumming (2009, p. 93), "evidence for direct causal impacts from assessments remains diffuse given the complex range of interrelated variables associated with assessment in language education." It is well recognized that washback is shaped by many factors other than test design, but the challenge for test developers and washback researchers is to determine how much and which specific washback can be "evidentially linked" (Messick, 1989) to the test itself and the messages transmitted about the test by the test developers. A recent study by Wall and Horák (2006, 2008, in press) attempted to do this, investigating how changes in the new TOEFL iBT® affected specific teachers over a five-year period. The research started with a baseline study that documented how the teachers conducted their classes before they knew that a new test would be introduced. It then tracked the teachers' reactions as they learned about the new test requirements, grappled with new constructs, searched for appropriate materials, and eventually designed new test preparation courses.

Interestingly, much of the washback literature deals with the effect of tests on teachers and teaching, with fewer studies addressing the reactions of learners or other test takers. Recent work by Huhta and Pitkänen-Huhta (2006) attempts to redress the balance, using

data gathered from secondary school students preparing for a high-stakes national examination. The students were asked to keep an oral diary (using portable recording devices) of their perceptions and expectations of the test and of their own performance, and to participate in group interviews with fellow students to discuss these themes. The authors used a discourse analysis framework derived from social psychology to reveal the different ways in which the students were affected by the test. They hoped their findings would lead to ways of helping learners to cope with the pressures of high-stakes testing, including self-assessment instruments and more individualized test preparation materials and activities.

There are a number of challenges still facing those who are interested in creating or investigating washback. The first of these is understanding the crucial role that contextual factors play in washback research. The second is deciding when test preparation activities cross the line between developing the types of language and strategies test takers need in the real world and intensive cramming that may lead to higher test results but reveal little about the test takers' true mastery of the domain being assessed. Haladyna, Nolen, and Haas (1991) used the term "test score pollution" to describe the latter situation, while Hamp-Lyons (1998) questioned the ethicality of some preparation washback practices. The third challenge is agreeing whose responsibility it should be to ensure that tests have the washback policy makers and test producers intended, rather than unintended and detrimental consequences. The fourth is understanding that washback is but one of many possible consequences of high-stakes testing, which is a prominent theme in the literature on critical language testing (Shohamy, 2001). Perhaps the biggest challenge, however, is getting test developers to respond to the washback research that has been produced so far, and to analyze their own methods of communicating with test users and helping them to interpret and react appropriately to test demands.

Web-Based Lexical Resources

TATSUYA NAKATA

The Internet offers numerous lexical resources that are useful for teaching, learning, and researching lexis. Useful resources for teachers and learners include online dictionaries, vocabulary support software for reading, word lists, vocabulary tests, vocabulary learning software, corpora, concordancers, vocabulary profilers, guides for teaching and learning vocabulary, and vocabulary quizzes. Researchers will benefit from bibliographies on vocabulary, online articles, and lexical databases. Most resources can be used free of charge, and knowing how to find and use these resources will be valuable for language teachers, students, and researchers.

Resources for Teachers and Students

Dictionaries

Numerous online dictionaries can be found on the Internet. Computer-based dictionaries, including Web-based ones, offer several benefits that paper-based ones do not (Rizo-Rodríguez, 2008). First, the former allow users to carry out more complex searches than the latter such as backward match (e.g., search all words that end with *-ment*) and wild cards search (e.g., search all words that start with *f-* and end with *-ment*). Second, most Web-based dictionaries can play audio recordings of foreign language words, which is a feature exclusive to computer-based dictionaries. Third, some Web-based dictionaries, although freely accessible, offer almost the same content as paid paper or CD-ROM dictionaries including definitions, parts of speech, example sentences, phrases, collocations, idioms, phonetic symbols, illustrations, and usage notes. Freely accessible online dictionaries include *Oxford Advanced Learner's Dictionary* (www.oxfordadvancedlearnersdictionary.com), *Cambridge Advanced Learner's Dictionary* (<http://dictionary.cambridge.org/>), *Collins COBUILD Student Dictionary* (www.collinslanguage.com/shop/english-cobuild.aspx), *Longman Dictionary of Contemporary English* (www.ldoceonline.com), *Merriam-Webster Dictionary* (www.merriam-webster.com), and *Roget's Thesaurus* (<http://education.yahoo.com/reference/thesaurus/>). OneLook Dictionary Search (www.onelook.com) is a very useful Web site because it enables users to search multiple dictionaries at once. Using this Web site, one can search 1,062 dictionaries including *Compact Oxford English Dictionary*, *Cambridge Dictionary of American English*, *Collins COBUILD Student Dictionary*, and *Merriam-Webster's Online Dictionary* with just a single click of the mouse.

Vocabulary Support Software for Reading

Although online dictionaries are very useful, looking up words in a dictionary during reading may sometimes interrupt the reading process and hinder comprehension. When reading texts, learners may want to have a less disruptive form of lexical support than dictionaries, such as glosses (Nation, 2001, p. 175). Glossing Authentic Language Texts (GALT; <http://larc.sdsu.edu/professional-development/>) and Comet (<http://comet.cls.yale.edu/>) allow teachers to create glosses using texts, images, audios, and videos. These programs are helpful because research shows that computer-based glosses increase both lexical learning and reading comprehension (Abraham, 2008).

Pop-up dictionaries also offer vocabulary support during reading in a less disruptive manner than regular dictionaries. Pop-up dictionaries refer to programs that enable users to look up the meaning of words through single clicking, double clicking, or mouse hovering. WordChamp Web Reader (www.wordchamp.com/lingua2/Reader.do) and POPjisy.com (www.popjisy.com) are Web-based pop-up dictionaries and can be used with any Web site or text that is pasted into a box on their Web sites. These dictionaries are less time consuming than regular online dictionaries and may encourage more frequent lookups and potentially improve lexical learning.

Hypertext Builder (www.lex tutor.ca/hypertext/; Cobb, 2007) is another useful program. The software allows users to get definitions and hear pronunciation of words used in a particular text with just one or two clicks of the mouse. The program also lets learners study concordance lines of words. Concordance lines refer to sentences derived from a corpus. Viewing concordances may help learners study collocations, grammatical patterns, or idioms of a word (see the section “Corpora and Concordancers” below for more details). Hypertext Builder also enables learners to set aside words that they have encountered during reading and practice them in various quizzes including dictation (www.lex tutor.ca/spelling/dictator/), cloze (www.lex tutor.ca/concordancers/multi/), and word identification exercises (www.lex tutor.ca/id/).

Word Lists

Word lists compiled based on frequency are very useful because the frequency of a word gives learners a good indication of how useful the word is (Nation, 2001, pp. 6–22, 2008, pp. 7–15). In English, for instance, the most frequent 2,000 word families account for around 80 percent of the running words in most texts (Nation, 2008, p. 8), and acquiring these words is one of the most important goals in the initial stage of language learning. Word frequency lists help teachers and learners to determine which words are high frequency and need more attention than others. For instance, learners can go over frequency lists to see if there are any high-frequency but unfamiliar words, which need to be learned deliberately through flashcards or dictionaries (Nation, 2001, p. 16). In elementary classes, teachers can consult frequency lists to make sure that a considerable amount of time is spent on them.

A classic English frequency list is Michael West’s (1953) General Service List (GSL), which consists of 1,986 word families (Nation, 2004). Because the GSL was compiled more than half a century ago, it does not contain modern words such as *television*, *computer*, or *online*. Yet, research suggests that the list is still useful even today (Nation, 2001, pp. 15–16, 2004). GSL can be found at Paul Nation’s Web site (www.victoria.ac.nz/lals/resources/vocrefs/), Compleat Lexical Tutor (http://conc.lex tutor.ca/list_learn/eng/), and James Dickins’s Web site (www.languages.salford.ac.uk/staff/dickins.php).

If more up-to-date English frequency lists are needed, ones based on the British National Corpus (BNC) are very useful. In addition to being more up-to-date, BNC lists contain more items than GSL. Paul Nation’s BNC lists, for instance, consist of 14,000 word families. BNC frequency lists can be downloaded from the Web sites of Paul Nation (www.victoria.ac.nz/lals/staff/paul-nation.aspx), Adam Kilgariff (<http://www.kilgariff.co.uk/bnc-readme.html>), and Geoffrey Leech and his colleagues (<http://ucrel.lancs.ac.uk/bncfreq/>).

After learning the most frequent 2,000 word families, it is recommended that learners acquire academic vocabulary (Nation, 2001, pp. 6–22). The Academic Word List (AWL; Coxhead, 2000) is the most widely used list of English academic vocabulary. The list consists of 570 word families that are outside the GSL and occur frequently in a wide range of academic disciplines such as arts, commerce, science, and law. The AWL words are very useful as they account for 8.5–10 percent of academic texts (Coxhead, 2000). Considering that the third 1,000 most frequent words account for only 4.3 percent of natural texts

(Coxhead, 2000), learning 570 AWL words is very efficient. The AWL can be found at Averil Coxhead's Web site (www.victoria.ac.nz/lals/resources/academicwordlist/default.aspx) and Compleat Lexical Tutor (http://conc.lextutor.ca/list_learn/eng/).

Vocabulary Tests

Vocabulary tests are very useful tools for determining what kinds of words students already know and should be focusing on next. The most widely used English vocabulary test is perhaps the Vocabulary Levels Test (VLT; e.g., Nation, 2001). VLT measures whether learners have acquired the most frequent 1,000, 2,000, 3,000, 5,000, and 10,000 word families as well as the AWL words. VLT can be found at Paul Nation's Web site (www.victoria.ac.nz/lals/resources/vocrefs/) and Compleat Lexical Tutor (www.lextutor.ca/tests/). The 1,000 and 2,000 word level tests are also available in bilingual versions for Chinese, Indonesian, Japanese, Korean, Russian, Samoan, Tagalog, Thai, Tongan, and Vietnamese (www.victoria.ac.nz/lals/resources/vocrefs/). The bilingual versions are appropriate for learners with limited proficiency (Nation, 2008, p. 158).

Although VLT is very useful, it covers only limited word levels (words in the 4,000, 6,000, 7,000, 8,000, and 9,000 levels are not tested in VLT) and is not designed to measure learners' overall vocabulary size. If teachers want to estimate the number of words that their students know, the Vocabulary Size Test (VST; Nation & Beglar, 2007) will be useful. VLT measures learners' vocabulary size from the first 1,000 to the fourteenth 1,000 word families and is more comprehensive than VLT. VST can be found at Paul Nation's Web site (www.victoria.ac.nz/lals/resources/vocrefs/), VocabularySize.com (<http://vocabularysize.com>), and Compleat Lexical Tutor (www.lextutor.ca/tests/). In addition to the English monolingual version, VST is also available in bilingual versions for Chinese, Korean, Japanese, and Vietnamese (www.victoria.ac.nz/lals/resources/vocrefs/ and <http://vocabularysize.com>).

In addition to VLT and VST, there are many other online vocabulary tests available. Paul Meara's *_lognostics* offers a wide range of lexical tests including V_Quint, X_Lex, Y_Lex, and LEX30 (<http://www.lognostics.co.uk/tools/index.htm>). Compleat Lexical Tutor (www.lextutor.ca/tests/) also offers Web-based versions of the Productive Vocabulary Levels Test (Laufer & Nation, 1999), the Word Associates Test (Read, 1998), and Eurocentres Vocabulary Size Test (Meara, 1992).

Vocabulary Learning Software

The Internet offers numerous vocabulary learning programs, most of which are computer-based flashcard software. In these programs, target items are presented outside meaning-focused tasks, and learners associate the second language word form with its meaning, usually in the form of a first language translation, second language synonym, or definition.

Examples of Web-based flashcard programs include iKnow (<http://iknow.jp/>), WordChamp (www.wordchamp.com), Quizlet (<http://quizlet.com/>), and FlashcardExchange (www.flashcardexchange.com/). Programs such as SuperMemo (www.supermemo.com), vTrain (www.vtrain.net), MemoryLifter (www.memorylifter.com), Anki (<http://ichi2.net/anki/index.html>), Mnemosyne (www.mnemosyne-proj.org/), Pauker (<http://pauker.sourceforge.net/>), and FullRecall (<http://fullrecall.com/>) are not Web-based, but are available for download on the Internet (Godwin-Jones, 2010).

Most computer-based flashcards are appropriate for learners of any language at any level because they allow users to create their own flashcards in any language. For instance, all the programs mentioned above can be used for learning any language as long as a Unicode-compatible font is available. These programs, moreover, provide a wide selection of readymade flashcards for various languages including English, French, German, Spanish,

Russian, and Arabic. By using these flashcards, learners can study many vocabulary items while avoiding the time-consuming task of flashcard creation. (However, note that the supporting documentation for flashcard programs is not always available in the learner's first language. For instance, Quizlet offers supporting documents only in English, and the software may not be suitable for non-English readers.)

Nakata (2011) surveyed nine commercially or freely available lexical learning programs and found that there are discrepancies in the way flashcard programs are designed. His study suggests that, unfortunately, some existing flashcard programs might not have been developed according to learning principles and may be less effective than others. Learners who want to study with computer-based flashcards, therefore, may need to exercise caution when deciding which software to use. Seventeen criteria for evaluating flashcard programs proposed by Nakata (2011) may serve as useful guidelines for choosing good flashcard software.

Software reviews may also be helpful for students who want to find flashcard programs that suit their needs. Reviews of vocabulary software can be found at *Language Learning & Technology Archives: Multimedia Reviews* (<http://llt.msu.edu/archives/software.html>), *CALICO Journal: Software reviews* (<http://calico.org/page.php?id=169>), an online article by Godwin-Jones (2010; <http://llt.msu.edu/vol14num2/emerging.pdf>), Memorization software review (www.quingle.com/softarea/flash.htm), and Fool's Flashcard Review: Flashcard Software Reviews for Language Learners (<http://foolsworkshop.com/reviews/>).

Corpora and Concordancers

Corpora (or *corpus* in its singular form) refer to a collection of electronic texts that are assembled for a particular purpose in a systematic manner (O'Keeffe, McCarthy, & Carter, 2007, p. 1). Although corpora have been used mainly by researchers and lexicographers, they can be useful for teachers and students as well. For instance, teachers can create example sentences or cloze exercises based on sentences extracted from corpora. Learners can search a particular word in corpora for studying collocations, idioms, grammatical patterns or *semantic prosody* (whether the word has a positive or negative connotation) of a word (O'Keeffe et al., 2007, p. 14).

The Internet offers numerous Web-based corpora. For instance, BNC (British National Corpus) and Bank of English, the two most widely known English corpora, are available online at BYU-BNC: British National Corpus (<http://corpus.byu.edu/bnc/>) and COBUILD Concordance and Collocations Sampler (www.collins.co.uk/Corpus/CorpusSearch.aspx), respectively. Compleat Lexical Tutor's Online Concordancers (www.lextutor.ca/concordancers/) allow users to examine English (e.g., Brown Corpus, BNC samplers and selected sub-corpora), French (e.g., Le Monde), German (Braun Corpus), and Spanish (Bruno) corpora. These Web sites are particularly useful for investigating how a particular word is used in context. For instance, if users search for *try* in Compleat Lexical Tutor's Corpus Concordance English (http://www.lextutor.ca/concordancers/concord_e.html), the Web site will display all the sentences containing the word from a selected corpus (Figure 1). By studying these concordance lines, learners can find out that *try* can be followed by both a *to*-infinitive and gerund although they have different meanings. (For instance, *tried to swim* does not necessarily imply that the speaker swam while *tried swimming* indicates that the speaker did swim.)

Corpora are also useful for extracting common collocations. Collocations refer to sets of words that often co-occur such as *take a break*, *make a decision*, or *a bitter disappointment* (Nesselhauf, 2003). Several Web-based programs can give a list of common collocations for a given word. Such programs include Just The Word (www.sle.sharp.co.uk/justtheword), BYU-BNC: British National Corpus (<http://corpus.byu.edu/bnc/>), and COBUILD Concordance

Figure 1 Concordance lines of *try* from the Brown Corpus using Compleat Lexical Tutor's Corpus Concordance English (www.lexutor.ca/concordancers/concord_e.html)

and Collocations Sampler (www.collins.co.uk/Corpus/CorpusSearch.aspx). These programs are useful because they may help learners find natural, appropriate expressions. Using these programs, for instance, students can discover that *drive* often collocates with *bus*, *car*, *truck*, *van*, or *taxi* (Figure 2, top) while *ride* tends to co-occur with *bicycle*, *bike*, *tricycle*, *horse*, or *camel* (Figure 2, bottom; Schmitt, 2000, p. 88).

Concordancers (also known as concordance software) refer to software for analyzing corpora and are also a very useful tool. These programs enable users to study concordance lines of words, create frequency word lists, examine collocations and multiword units, and identify keywords in texts (O'Keeffe et al., 2007). Concordancers can be used for hand-made corpora as well as preexisting corpora such as BNC.

Examples of concordancers include AntConc (<http://www.antlab.sci.waseda.ac.jp/software.html>), Wordsmith (www.lexically.net/wordsmith/), and MonoConc (www.michaelbarlow.com). AntConc is suitable for teachers and students because it is user-friendly freeware. Although freely available, the program is as versatile as most commercial concordancers (Schmitt, 2010, p. 336).

Figure 3 shows results of keyword analysis using AntConc. Keywords, in this context, refer to words that occur more frequently than expected at a statistically significant level. AntConc identifies keywords in a given corpus by comparing it against a reference corpus. In this example, a collection of applied linguistic articles on vocabulary acquisition is compared against a corpus of economic texts. Figure 3 indicates that keywords related to vocabulary learning may include *words*, *vocabulary*, *language*, *learning*, *learners*, *reading*, *students*, *knowledge*, *test*, and *lexical*. In other words, these words occur significantly more frequently in articles on vocabulary acquisition than in economic texts and may play an important role in the former. The identification of keywords may be useful for teaching and learning technical vocabulary.

Figure 3 Results of keyword analysis using the AntConc concordancer (Laurence Anthony, Waseda University; www.antlab.sci.waseda.ac.jp/software.html)

On the Internet, one can also find corpora for languages other than English. The Web sites of David Lee (www.uow.edu.au/~dlee/corpora2.htm) and Richard Xiao (www.lancs.ac.uk/fass/projects/corpus/cbls/corpora.asp) provide extensive lists of such corpora (Schmitt, 2010, p. 308). Examples include European Corpus Initiative Multilingual Corpus (www.elsnet.org/resources/eciCorpus.html), The German National Corpus (www.dwds.de/cgi-bin/rest/loginstart), The Russian Reference Corpus (<http://bokrcorpora.narod.ru/index-en.html>), The Lancaster Corpus of Mandarin Chinese (www.lancs.ac.uk/fass/projects/corpus/LCMC/), and Kotonoha (Japanese; www.ninjal.ac.jp/kotonoha/).

Vocabulary Profilers

Vocabulary profilers refer to computer programs that compare a text against word lists specified by the user. These programs allow users to create their own frequency lists, identify words that are or are not shared by various texts, find words that are likely to be unknown to students of certain vocabulary knowledge, evaluate students' productive vocabulary knowledge, or estimate the vocabulary load of materials (Webb & Nation, 2008).

Examples of vocabulary profilers include the RANGE program (www.victoria.ac.nz/lals/staff/paul-nation.aspx) and AntWordProfiler (www.antlab.sci.waseda.ac.jp/software.html), both of which are freely downloadable. Compleat Lexical Tutor also provides RANGE (www.lextutor.ca/range/) and Vocabulary Profilers (www.lextutor.ca/vp/). The difference between RANGE and Vocabulary Profilers is that the former can analyze multiple text files simultaneously while the latter can process only one at a time.

Guides for Teaching and Learning Vocabulary

In recent years, numerous empirical studies have been conducted on vocabulary acquisition (e.g., Nation, 2001; Schmitt, 2007, 2008). These studies have contributed to our knowledge of how lexis should be taught and learned. However, teachers and learners tend to have misconceptions about what constitutes an effective vocabulary learning technique (Folse, 2004). On the Internet, there are many research-based guides for teaching and learning lexis that may help teachers and students who might have been misinformed about effective learning techniques.

For instance, works by Paul Nation (www.victoria.ac.nz/lals/staff/paul-nation-pubstopic.aspx) offer very valuable insights into how vocabulary should be taught and learned. Articles written by Norbert Schmitt (2007, 2008), which are freely accessible at his Web site (<http://www.nottingham.ac.uk/~aezweb/research/cral/doku.php?id=people:schmitt>), also offer helpful suggestions for vocabulary teaching and learning. Other useful guides can be found at Rob Waring's Web site (<http://www.robwaring.org/vocab/principles/index.htm>) and in an online article by Godwin-Jones (2010). The latter provides a list of Web-based resources on memorization techniques such as the keyword method, peg method, and semantic mapping (<http://llt.msu.edu/vol14num2/emerging.pdf>).

Vocabulary Quizzes

There are many Web sites that help teachers to create quizzes for vocabulary building. For instance, Compleat Lexical Tutor (www.lextutor.ca) allows users to create various exercises including dictation (www.lextutor.ca/spelling/dictator/), cloze (www.lextutor.ca/concordancers/multi/), and word recognition quizzes (www.lextutor.ca/id/). Puzzlemaker (<http://puzzlemaker.discoveryeducation.com/>) helps users to create quizzes such as word searches, crossword puzzles, and letter tiles. General purpose authoring tools including Hot Potatoes (<http://hotpot.uvic.ca/>), Moodle (<http://moodle.org/>), comet (<http://comet.cls.yale.edu/>), and SMILE (<http://clear.msu.edu/teaching/online/mimea/smile/v2/index.php>) can be used to create vocabulary exercises as well (Otto & Pusack, 2009).

Resources for Researchers

The Internet offers a wealth of valuable resources for researchers too. Paul Nation's Web site (www.victoria.ac.nz/lals/staff/paul-nation.aspx), Tom Cobb's Compleat Lexical Tutor (www.lextutor.ca/), and Paul Meara's _lognostics (www.lognostics.co.uk/) are perhaps the most comprehensive ones available. Paul Nation's Web site provides a bibliography on vocabulary, numerous articles on vocabulary, word lists, vocabulary tests, vocabulary

profilers, suggestions for research topics, and supplementary materials for his 2001 book (Nation, 2001). Compleat Lexical Tutor offers a wide range of vocabulary research tools such as online vocabulary tests (www.lextutor.ca/tests/); text analysis programs, for example, RANGE (www.lextutor.ca/range/), VocabProfilers (www.lextutor.ca/vp/), N-Gram (<http://conc.lextutor.ca/tuples/eng/>), KeyWords Extractor (www.lextutor.ca/keywords/); Web-based corpora (www.lextutor.ca/concordancers/); a reaction timer (www.lextutor.ca/rt/); statistical test calculators (www.lextutor.ca/stats/); and text processing utilities (www.lextutor.ca/tools/). Paul Meara's *_lognostics* provides a bibliography on vocabulary acquisition (<http://www.lognostics.co.uk/varga/index.htm>), a collection of articles on vocabulary (<http://www.lognostics.co.uk/vlibrary/index.htm>), computer-based vocabulary tests, and text analysis programs (<http://www.lognostics.co.uk/tools/index.htm>).

For lexicographers, the Web site of Euralex (www.euralex.org) provides a wealth of valuable resources. For Corpus and Computational Linguistics, the Web sites of David Lee (www.uow.edu.au/~dlee/CBLLinks.htm), Richard Xiao (<http://www.lancs.ac.uk/fass/projects/corpus/cbls/corpora.asp>), and Stanford Natural Language Processing Group (<http://www-nlp.stanford.edu/links/statnlp.html>) offer valuable information about a wide range of corpora and text analysis tools (Schmitt, 2010, pp. 308, 335).

Bibliographies on Vocabulary

There are several Web-based bibliographies that are valuable for vocabulary researchers. Vocabulary Acquisition Research Group Archive (VARGA; <http://www.lognostics.co.uk/varga/index.htm>), Paul Nation's Bibliography on Vocabulary (www.victoria.ac.nz/lals/resources/vocrefs/bibliography.aspx), and Rob Waring's Bibliography (<http://www.robwaring.org/vocrefs/vocref.html>) are among the most comprehensive ones available. VARGA is particularly noteworthy for two reasons. First, it is a searchable database and allows users to find vocabulary research according to keywords, publication years, or authors. Second, it is more up-to-date than the other two.

More specialized bibliographies include Euralex Bibliography of Lexicography (<http://euralex.pbworks.com/>), Learner Corpus Bibliography (<http://cecl.fltr.ucl.ac.be/learner%20corpus%20bibliography.html>), and ACL Anthology: A Digital Archive of Research Papers in Computational Linguistics (<http://aclweb.org/anthology-new/>).

Articles on Vocabulary

As well as bibliographies, articles on lexis are also freely accessible on the Web. *Reading in a Foreign Language* (<http://nflrc.hawaii.edu/rfl/PastIssues/topic.html#Lex>) and *Language Learning & Technology* (http://llt.msu.edu/archives/by_topic.html#Vocabulary), both of which are international refereed journals, have a collection of freely downloadable articles related to lexis.

Furthermore, numerous articles on lexis are available at the personal Web sites of researchers. Examples include the Web sites of Paul Nation (www.victoria.ac.nz/lals/staff/paul-nation-pubsdate.aspx), Paul Meara (<http://www.lognostics.co.uk/vlibrary/index.htm>), Norbert Schmitt (www.nottingham.ac.uk/~aezweb/research/cral/doku.php?id=people:Schmitt), and Tom Cobb (www.lextutor.ca/cv/#Publications).

Lexical Databases

One can find many lexical databases on the Internet. For example, MRC Psycholinguistic Database (http://www.psy.uwa.edu.au/mrcdatabase/uwa_mrc.htm) and CELEX (www ldc.upenn.edu/Catalog/CatalogEntry.jsp?catalogId=LDC96L14, <http://celex.mpi.nl/>) have been used mainly by psycholinguists and are useful for controlling vocabulary related

variables in experiments. For instance, suppose you are looking for high-frequency, monosyllabic, abstract English nouns or seven-letter, polysyllabic, concrete nouns that have an irregular plural form. By specifying variables such as the frequency, number of syllables, number of letters, concreteness ratings, familiarity ratings, or the parts of speech, you can obtain a list of words that satisfy your criteria.

The Edinburgh Associative Thesaurus (www.eat.rl.ac.uk) and The University of South Florida Free Association Norms (<http://web.usf.edu/FreeAssociation/>) are very helpful for researchers investigating word associations. These databases allow users to investigate which words are strongly associated with a given word. According to The Edinburgh Associative Thesaurus, for instance, native speakers of English tend to associate *rain* with *snow*, *wet*, *sun*, *fall*, *umbrella*, *clouds*, *UK*, and *Spain*.

Other useful lexical databases include WordNet (<http://wordnet.princeton.edu/>), English Lexicon Project (<http://ellexicon.wustl.edu/default.asp>), MCWord: An Orthographic Wordform Database (www.neuro.mcw.edu/mcword/), The Irvine Phonotactic Online Dictionary (www.iphod.com), and The Phonotactic Probability Calculator (<http://www.people.ku.edu/~mvitev/PhonoProbHome.html>). More resources can be found at Behavior Research Methods Supplementary Material (<http://brm.psychonomic-journals.org/content/supplemental>).

Lexical databases for languages other than English are also accessible online. They include EuroWordNet (Dutch, Italian, Spanish, German, French, Czech, and Estonian; www.illc.uva.nl/EuroWordNet/), CELEX (English, German, and Dutch; www ldc.upenn.edu/Catalog/CatalogEntry.jsp?catalogId=LDC96L14), Lexique (French: www.lexique.org), WordGen (English, French, German, and Dutch; http://users.ugent.be/~wduyck/Wouter_Duyck/wordgen.html), and Database of Japanese Vocabulary (<http://www.lang.nagoya-u.ac.jp/~ktamaoka/down.htm>). Behavior Research Methods Supplementary Material also includes lexical databases for various languages including English, French, German, Spanish, Dutch, Portuguese, and Japanese (<http://brm.psychonomic-journals.org/content/supplemental>).

In order to control for participants' prior knowledge, some researchers choose to use pseudowords in their research. Pseudowords, which are also referred to as nonsense words, nonwords, or artificial words, refer to strings of characters that do not really exist in a given language. For instance, *defermication*, *sepretenial*, and *fennerizer* are all pseudowords in English (Gathercole, 1995). The ARC Nonword Database (www.maccs.mq.edu.au/~nwdb/), Wuggy: A Multilingual Pseudoword Generator (<http://crr.ugent.be/programs-data/wuggy>), and Space Aliens and Nonwords (<http://brm.psychonomic-journals.org/content/36/4/599/suppl/DC1>) may help researchers to choose or create pseudowords that are suitable for their experiments. English Lexicon Project, MCWord: An Orthographic Wordform Database, The Irvine Phonotactic Online Dictionary, and WordGen, which are mentioned above, also contain some pseudowords.

Conclusions

As the above discussion has shown, the Internet offers a wide range of valuable lexical resources for language teachers, learners, and researchers. Resources such as online dictionaries, word lists, vocabulary tests, corpora, and concordancers may facilitate teaching and learning of vocabulary. Researchers will benefit from bibliographies on vocabulary, online articles, and lexical databases. With the advance in information technology and vocabulary research, more useful resources will continue to appear in the future.

Webster and American Lexicography

SONJA LAUNSPACH

Noah Webster (October 16, 1758–May 28, 1843) was a patriot, a prolific writer, and an educational reformer. A pioneering educator, he wrote many influential textbooks, grammars, and readers. His blue-backed speller was used for 100 years after his death. His most important accomplishment, however, was *An American Dictionary of the English Language*, published in 1828, a work that shaped the course of American lexicography.

Webster, the fourth child of a Connecticut farmer, graduated from Yale in 1778. Unable to afford law school, he worked for several years as a teacher. He later graduated from law school in 1784, and although he worked as a lawyer for a short time, he spent most of his life involved in education and scholarship. In 1789, he married Rebecca Greenleaf; he and his wife had eight children.

As a patriot, Webster worked, along with others such as Alexander Hamilton, to shape the politics of the new nation (Jones, 1993). As part of his strong nationalistic feelings, Webster felt it was important to create an American English distinct from British English. As an educator and language reformer, Webster worked to promote a “correct” standard for the writing, spelling, and pronouncing of American English.

Webster’s early experiences as a teacher led him to become an educational reformer. To fill the gaps in the educational materials available to students, he wrote textbooks that stressed American usage and pronunciation. His readers were the first to introduce secular material from American authors. In 1783, he published the blue-backed speller, Part 1 of his three-part *Grammatical Institute of the English Language*. Used until the early 1900s, the blue-backed speller would eventually sell approximately 80 million copies (Baugh as cited in Cannon, 1972).

While Webster continued to write textbooks for the rest of his career, in 1804 he turned his attention to compiling dictionaries, a task that would occupy the rest of his working life. In 1806, he published the *Compendious Dictionary of the English Language*, a revised and expanded version of Entick’s *New Spelling Dictionary* (Micklethwait, 2000). Then, in 1807, he began work on his *American Dictionary of the English Language*, a project he would not complete until 1828.

Like all of his contemporaries, Webster drew heavily on earlier publications. For instance, his dictionary owes a great debt to Samuel Johnson’s *Dictionary of the English Language*. Johnson’s methodology and presentation format have influenced all subsequent English-language dictionaries. Webster used Todd’s 1818 revision of Johnson’s dictionary as his “working base” and approximately one third of Webster’s definitions were copied from or influenced by Johnson (Landau, 2005). Despite his reliance on Johnson, Webster criticized him for the omission of words, an inadequate pronunciation system, problematic etymologies, and the use of too many quotations to illustrate a word’s meaning.

Webster initiated many innovative practices that would become standard in modern dictionaries. For example, he used a minimum of examples to illustrate a word’s usage, introduced the use of diacritical marks, and was noted for the conciseness and clarity of his definitions. However, his etymologies were unsound. Having a provincial mindset, he ignored European language scholarship, attempting instead to fit his etymologies into a biblically based theory of language origins (Moss, 1984).

While Webster's intellectual interests lay in educating American readers, he approached publication from a practical perspective. Motivated by a need to protect and control the rights and profits of his work, Webster worked to establish the first copyright laws in the United States (Micklethwait, 2000).

Nor was Webster's the only dictionary published in early America. In 1816, John Pickering published *A Vocabulary, or Collection of Words and Phrases Which Have Been Supposed to Be Peculiar to the United States of America*. However, Webster's chief competitor was Joseph Worcester, another scholar and lexicographer, who published a series of dictionaries beginning in 1817 with his *Geographical Dictionary, or Universal Gazetteer, Ancient and Modern*. In 1830, his *Comprehensive Pronouncing and Explanatory English Dictionary* appeared. Worcester, like Webster, contributed features now found in modern dictionaries. Worcester's *Dictionary of the English Language*, published in 1860, was the first American dictionary to include illustrations and synonyms.

In 1834, the 30-year war of the dictionaries began when a newspaper article accused Joseph Worcester of plagiarizing Webster's work in his 1830 dictionary. Webster, fiercely competitive and easily offended, instigated a public exchange of letters with Worcester in which various charges and countercharges were made by both men (Kraus, 1986).

Although Webster died in 1843, the publishers of the two men took up the battle, and Worcester became caught between the rival publishers, who launched various campaigns, including pamphlets and testimonials against each other in an effort to sell their product. The death of Joseph Worcester in 1865 as well as changes in the way dictionaries were compiled effectively ended the dispute.

After Webster's death, George and Charles Merriam acquired the rights to Webster's dictionary from his heirs. They established an editorial board for the dictionary and commissioned several different revisions (Kraus, 1986). First, Webster's son-in-law, Chauncey A. Goodrich, revised the dictionary in 1847. Then philologist C. A. F. Mahn eliminated the earlier problematic etymologies and moralistic definitions in the 1864 Webster-Mahn edition.

As part of a market-driven approach, Merriam used slogans to revive Webster's reputation, ultimately making Webster's name synonymous with dictionaries. Eventually, Merriam lost exclusive rights to Webster's name and now other American dictionary publishers also use his name to sell their products.

Noah Webster had a lasting influence on the development of American English in the areas of spelling and lexicography. And although none of his original 1828 dictionary is still used, the association of his name with American dictionaries remains.

Welsh Language Board and Bòrd na Gàidhlig

WILSON MCLEOD

Bwrdd yr Iaith Gymraeg (the Welsh Language Board) and Bòrd na Gàidhlig are the statutory bodies charged, respectively, with the promotion of the Welsh language in Wales and the Gaelic language in Scotland. Their formal roles are broadly similar, but the Welsh Language Board is a much larger organization than Bòrd na Gàidhlig and was initially established almost fifteen years earlier. Further, it appears likely that the board will shortly be abolished, and its functions taken over by a new Welsh language commissioner. Both bodies take an active role in the Network of European Language Planning Boards, a consortium which also includes the counterpart boards working on behalf of Basque, Catalan, Frisian, Galician, Irish, and Swedish (in Finland).

The Welsh Language Board was established in 1988 as a voluntary organization but gained formal statutory powers with the enactment of the Welsh Language Act 1993. The board plays a central role in a wide range of language planning activities in relation to the Welsh language, initiatives which gained new momentum following devolution and the creation of the Welsh Assembly in 1999. Among other things, the board has facilitated the development and overseen the implementation of Welsh-language schemes by public bodies in Wales, including branches of the United Kingdom government based in London. More than 650 of these schemes have now been put in place, with the aim of implementing the Act's principle that the Welsh and English languages should be treated on a "basis of equality." Many of these schemes closely track the board's formal guidance on their preparation (Welsh Language Board, 1996). The board has limited authority to conduct investigations concerning the implementation of schemes, but no direct enforcement powers. Along with extending the influence of the language schemes, other current priorities for the board include increasing the role of Welsh on the part of private businesses (which are not covered by the Welsh Language Act), in information technology, and among youth.

In recent years the status of the board has been controversial. In 2004 the Welsh Assembly Government proposed to abolish the board and merge it into the government itself, but this plan was eventually blocked by a majority in the Welsh Assembly. Following extensive discussions of possible improvements to the Welsh development infrastructure (see Williams, 2008), in March 2010 the Welsh Assembly Government introduced proposals for a new Welsh-language measure in the Welsh Assembly. Under the terms of this draft legislation, the board would be replaced by a new office of the Welsh language commissioner (a structure reflecting the influence of the Canadian model), whose powers would be significantly stronger than those of the board in several key respects, and a new mechanism of binding legal standards in relation to the Welsh language would come into effect in place of the language schemes.

The history and role of Bòrd na Gàidhlig mirror those of the Welsh Language Board to a considerable extent. (The organization does not have an English title, but the Gaelic form translates as "The Gaelic Board".) The Bòrd was established in 2003 as a "nondepartmental public body," but obtained statutory status with the enactment of the Gaelic Language (Scotland) Act 2005. The Act imposes a number of obligations upon the Bòrd. It must

publish a national Gaelic-language plan every five years, setting out a strategy for promoting Gaelic language, education, and culture. The first of these plans was published in 2007 and lasts until 2012 (Bòrd na Gàidhlig, 2007a). The Bòrd also has principal responsibility in relation to the development of Gaelic-language plans on the part of public bodies in Scotland, which correspond to the language schemes in Wales. To this end, the Bòrd must decide which bodies should be required to produce plans and then agree the specific terms of each plan, using its formal guidance (Bòrd na Gàidhlig, 2007b) as a template. As of May 2010, only seven plans had been agreed by the Bòrd, but a further 44 are expected by the end of 2013. In the same manner as the Welsh Language Board, the Bòrd has principal responsibility for funding the various Gaelic organizations in Scotland (in the fields of education, arts, publishing, and so on, but not including broadcasting); it also runs a scheme for supporting smaller-scale promotional initiatives of different kinds. The Bòrd also manages the Gaelic Language Act Implementation Fund, which helps defray some of the costs incurred by public bodies when implementing their Gaelic-language plans.

Compared to the Welsh Language Board, Bòrd na Gàidhlig is a significantly smaller organization, with only 18 staff compared to some 75, and it has so far not developed a comparable level of experience and professionalism. The organization has suffered from turbulence in relation to its leadership: The current chief executive and chair are the third to hold those posts. It is hoped that these difficulties will turn out to have been no more than growing pains. A new action plan published in April 2010, with a renewed focus on increasing numbers of Gaelic speakers, represents the Bòrd's latest strategic initiative.

Williams, Colin H.

DIARMAIT MAC GIOLLA CHRÍOST

Colin Williams is currently a research professor in the School of Welsh at Cardiff University (www.cardiff.ac.uk) and has, for many years, been internationally recognized for his expertise in language planning and policy and in the geography of language, in particular the Welsh language. He was born in south Wales in the popular coastal resort of Barry ('y Barri' in Welsh) where he attended Ysgol Gymraeg y Barri and was among the first cohort of pupils to attend Ysgol Uwchradd Rhydfelen (renamed Ysgol Gyfun Rhydfelen and now Ysgol Gyfun Garth Olwg), a school which pioneered the rapid and successful expansion of secondary level Welsh-medium education that occurred in Wales during the last quarter of the 20th century.

At that time pupils of Ysgol Uwchradd Rhydfelen were strongly encouraged to continue their higher level education at university in Wales, thus, upon leaving Rhydfelen Williams attended Swansea University where he graduated with an outstanding first (BSc Econ) in Geography and Politics in 1972. He immediately began his PhD research at Swansea on the subject of "Language Decline and Nationalist Resurgence," a comparison of the Welsh and Québécois situation. He was interested in also conducting research on the Biafran conflict which was afflicting Nigeria at that time (1967–70) but the region was deemed to be too dangerous for the purposes of fieldwork.

In 1973, during the course of his PhD research, he was awarded an English Speaking Union Scholarship, tenable at the Department of Geography, the University of Western Ontario, to conduct fieldwork on the French language in Quebec and Acadia. During his time there he developed an enduring intellectual interest in Canada, in the area of language policy and planning in particular. Upon his return to Wales he was appointed as an Open University tutor and a demonstrator at the Department of Geography, University College of Swansea, 1974–6. His first lectureship followed immediately at the Department of Geography at North Staffordshire Polytechnic (now Staffordshire University). He enjoyed an enormously successful career there as he was successively appointed lecturer, principal lecturer, and professor of Geography.

Williams was a youthful Head of Department at Staffordshire, and while the demands of teaching and administration were onerous his research interests matured. His article "Non-Violence and the Development of the Welsh Language Society, 1962–c.1974," published in 1977 in the journal *Welsh History Review* was largely responsible for introducing the language conflict in Wales to an English-language audience. His subsequent work in this area, in both English and Welsh, has substantially shaped the parameters of the scholarly study of the sociology of the Welsh language. This period of work, it could be argued, culminated in the publication of *Called Unto Liberty: On Language and Nationalism* (1994), a volume which remains well read amongst scholars of language and politics and has an enduring popular appeal.

International recognition of his work grew during his time at Staffordshire. In 1982–3 he was Fulbright Scholar in Residence and visiting professor at the Department of Geography, Pennsylvania State University. In 1988 he was a Swedish Institute Scholar (1988) at the Centre for the Study of International Conflicts in the Department of History at the University of Lund. In 1993 he was a Multicultural History Society of Ontario Fellow

in Toronto. His appointment as research professor at the School of Welsh, Cardiff University, in 1993 was a significant development in his academic career.

His professional return to Wales enabled him to become much more directly involved in the affairs of the Welsh language at a scholarly and professional level while at the same time his work became more widely known to a popular audience. His most important publications in this period include the three volumes *Language Revitalization in Wales: Policy and Planning* (2000), *Language and Governance* (2007), and *Linguistic Minorities in Democratic Context* (2008). Also in this period his scholarly expertise has been in much demand. Governmental agencies in Canada, Northern Ireland, the Republic of Ireland, Catalonia, and South Africa, for example, have all sought out his expert professional advice on language planning and policy.

In 2000 he was appointed a member of the Welsh Language Board by the National Assembly for Wales. This followed a period of several years of providing advice to the Welsh Language Board. As a member of the Welsh Language Board he has been hugely influential in the shaping of public policy on the Welsh language. While it is the case that his period as a member of the Board came to an end in 2010 (under UK regulations he is not able to serve for a further period, although it is certain that the Welsh Language Board would have been very keen for him to have been able to do so), he continues to be called upon by the National Assembly for Wales to offer guidance. The regard of his peers is reflected in his election to fellow of the prestigious Royal Society of Arts in the UK and in the various honorary appointments he holds including to the University of Western Ontario (adjunct professor of geography), the University of Aberdeen (honorary professor of Celtic studies) and at the University of the Highlands and Islands (honorary professor of Celtic studies). He is a member of the Scientific Committee of *Lingua Mon*, Barcelona and a member of the Editorial Boards of academic journals in the fields of language, education and geography. Colin Williams has also been the sympathetic and supportive supervisor and examiner of numerous PhD students who have gone on to pursue their own successful academic and professional careers in language policy and planning. For more information, visit his personal Web page at the Cardiff University Web site (www.cf.ac.uk/welsh/contactsandpeople/academicstaff/williams-colin.html).

Wittgenstein and Language Games in Qualitative Research

JOHN SHOTTER

I believe my originality (if that is the right word) is an originality belonging to the soil rather than to the seed . . . Sow a seed in my soil and it will grow differently than it would in any other soil. (Wittgenstein, 1980, p. 36)

What is happening now has significance—in these surroundings. The surroundings give it its importance. (Wittgenstein, 1953, No. 583)

I am in conversation with a friend. She is trying to tell me something complicated, but she goes from one sentence to the next too quickly for me to “follow” her. I begin to lose my sense of her words as meaning something to me and ask her to repeat what she has just said more slowly: “Ah, now I get it,” I say, “but could you go a little more slowly from now on?” My unfolding sense of my living, embodied relations to her talk, *and of its relations to our shared situation*, is crucial if I am to retain my grasp on her meaning and its development within me—for, although I cannot easily give a sequence of names to the emerging flow of events occurring within me, I can, nonetheless, have an acute discriminative sense of where she is “coming from,” as well as “where she is going” with it, what her “point” is. It is this unique qualitative sense of the unfolding “shape” of the spontaneous responses to her talk occurring within me that can guide me in shaping the more explicit responses that I might make to her talk. And the difficulty I overcame by my request to her was to do with me once again being able to *relate myself* to my friend’s talk.

It is the uniquely distinctive, qualitative character of these easily ignored feelings, these *situated sensings*—and their ineradicable importance in guiding and shaping our everyday talk together—that Wittgenstein wants to bring to our attention in his investigations. And it is the *relations* between our words and the surroundings within which we put them to *use* that he wants to draw to our attention, with his talk of them as occurring within the confines of one or another kind of language game.

In other words, Wittgenstein is interested in those *situations* that make it possible for us to use our words in teaching someone something, including, say, the teaching of scientific forms of inquiry. Indeed, as he puts it, he is concerned to inquire into “what is possible *before* all new discoveries and inventions” (Wittgenstein, 1953, No. 126). For, in his terms, scientific thinking arrives on the scene too late, and looks in the wrong direction, with the wrong aim in mind—*too late*, because as scientists we act as if the “basic elements” of our analyses are already “there” in existence as fixed, determinate, and nameable entities; *in the wrong direction*, because we look backward toward already existing actualities, rather than forward toward possibilities; and *with the wrong aim in mind*, because we seek a static picture, a theoretical representation, of a phenomenon, rather than a living sense of it as an active agency in our lives. Thus, as scientists, it is only too easy for us to think of “Language” as a self-contained thing or object that we need to inquire into if we are to understand its workings. But for Wittgenstein (1953), no such isolated thing as “language” exists. What we call the *linguistic* aspects of our everyday activities always occur within a particular situation, inextricably intertwined with a whole host of other activities. Thus,

as he sees it, it is how a word is *used* in relation to its particular surroundings that gives it its meaning. To remind us of this, he says, “I shall also call the whole, consisting of language and the actions into which it is woven, the ‘language-game’” (1953, No. 7)—where the idea of a game is meant to remind us that things occurring *within* a game have a quite different meaning or use to those occurring *outside* it.

When we consider certain words outside the surroundings of their actual everyday use, we can of course still give them a meaning—as we do, for instance, in compiling dictionaries. But what is lost is what uniquely a particular person in a particular situation meant in saying them. For the point of our uttering certain words (rather than others), and the circumstances in which they are voiced, and how they are voiced, is as much an aspect of their significance as what we are inclined, as theorists, to call their “meaning” or what they “represent.”

Wittgenstein’s Investigations and Scientific Research

This entry began in this way because—in trying to set out below the role that Wittgenstein’s (1953) *descriptive* concept of “language games” can play in our conduct of qualitative research—we need to see his work as exerting its influence upon us in a context quite different from that which has become familiar to us as a result of our training as rational thinkers and scientific investigators.

At the moment, one whole strand of scientific research still takes it that there is only one universe, that it is made of separate parts in motion, and that it is the task of research to identify these parts and to specify the general laws governing their motion. Traditionally, this has been described as a search for the “hidden mechanisms behind appearances” that we suppose to be responsible for shaping or organizing what we observe. A version of this presupposition is carried over into social scientific research in the assumption that it is the task of our minds to produce *inner representations* of these outer states of affairs, and that it is these hidden inner representations that shape our expressive activities. No matter what people themselves might say about why they acted, these hidden influences are often said to be the *real* reasons or causes of our actions. These assumptions have shaped a whole research process which begins with what we call the collection and *analysis* of *data*—a step in which we continuously pick out certain identifiable events as separable from their context of occurrence. The events so selected are then surveyed with the aim of finding a pattern within them so that, once such a pattern has been identified, a causal mechanism can be suggested as being possibly responsible for that pattern, and further tests made to see whether or not its “workings” can be detected in other contexts.

But, to the extent that certain focal events have been divorced in this process from their original surroundings, people’s utterances and other expressions need to be “given back” a *meaning* or *function* by being appropriately placed within a particular theoretical framework. The application of a large number of different *analytic perspectives* to linguistic materials and the different *interpretative roles* they can play in this kind of research process are explored in Silverman’s (2004) classic text on methods in qualitative research. All the perspectives and methods explored within it function in the manner described above. Indeed, as Silverman himself remarks about his own teaching of these methods: “I approach taught courses as workshops in which students are given skills to analyse data and so to learn the craft of our trade” (2004, p. 1). It is such analyses of abstracted data in terms of idealized frameworks that Wittgenstein wants to speak against.

Rather than being interested in the supposed hidden mechanisms of our minds, Wittgenstein is much more interested in the *soil*—the different soils, the different surroundings—to which we as living embodied beings are spontaneously responsive, and

within which we continue to grow, as the first quote at the beginning of this entry indicates. Thus, rather than the hidden mechanisms working beyond our control by which we suppose our intentions come to be given bodily expression, Wittgenstein is interested in exploring the distinctive discriminations that we can (and must) make use of, both in making sense of other people's utterances and in giving a shape to our own expressions. As he sees it, "nothing is hidden" (1953, No. 435), for the fact is—although it is very difficult for us to become aware of doing it while doing it—we draw on features of events occurring both around us and within us, as we work to make our use of words fit the circumstances of their use.

This appropriate use of words is an everyday skill in which we have been (and are still being) informally trained, as we live out our lives together with those around us. It is what makes our learning of the techniques of scientific forms of inquiry possible. But if we then try to turn these techniques around, if we try to do this by pursuing already existing text-book methods of a science-like inquiry—with all the idealizations, selective abstractions, and reifications they involve—then we can get ourselves into trouble. For, although it is easy for us to "lay down rules, a technique, for a [language] game," we often find that "when we follow the rules, things do not turn out as we had assumed. That we are therefore as it were entangled in our own rules" (1953, No. 125)—and we can mislead ourselves into ignoring once again influences exerted by the actual surroundings of our meaningful expressions.

Difficulties of Orientation and Language Games in Qualitative Research

One of Wittgenstein's great achievements in his later philosophy is to have made it very clear to us that there are two kinds of difficulty we can face in situations that bewilder us, not just one. Given our training as rational thinkers and scientific investigators, we are inclined to think of all the difficulties we face as *problems* that can be *solved* by the application of a science-like methodology. As Wittgenstein sees it, however, besides such *difficulties of the intellect* we can also face a *difficulty of the will*, a difficulty that manifests itself in what, spontaneously, "we *want* to see" (Wittgenstein, 1980, p. 17) in each new situation we encounter. Such *relational* or *orientational* difficulties as these cannot be overcome by the application of any of our current methods of inquiry. These difficulties are to do with the expectations and anticipations that have come to be embodied within us, with which we "go out to meet" the detailed features of our surroundings, thus to find our "way about" (No. 123) and to "go on" (No. 154) with our practices within them without (mis)leading ourselves into taking inappropriate next steps. The difficulties we need to overcome are therefore not of an epistemological kind, but are ontological ones to do with our own way of being in the world—they involve "a working on oneself . . . On one's way of seeing things. (And what one expects of them.)" (1980, p. 16).

And this is how Wittgenstein proceeds to induce us to work on ourselves, on our ways of seeing things and what we expect of them: Prior to his remarks in which he introduces the term "language games," he "sets the scene," so to speak, by asking us to draw on or to do what is already familiar to us. He writes: "Now think of the following use of language" (1953, No. 1); "Conceive this as a complete primitive language" (No. 2); "Imagine a script" (No. 4); "We could imagine that the language of §2 was the *whole* language" (No. 6), and so on. Instead of giving us a definition of the term, he asks us to call to mind a whole host of concrete everyday situations and activities, so that we can respond to each of his remarks by turning our attention to a particular feature in our use of language. Once we attend to it, it becomes quite evident to us. Indeed (and this is central to Wittgenstein's whole

approach), we exhibit our knowledge of how to make use of language continually in our everyday practices—it is not hidden away “behind appearances”, but the fact is, we no longer seem “to know [of it] when we are supposed to give an account of it” (No. 89).

Thus, straightaway, Wittgenstein engages us in a set of practices very different from those we normally undertake when faced with a bewildering or difficult situation. Instead of beginning with an *analysis* of it into its supposed elementary parts, he asks us to undertake a set of imaginative practices, or of different *ways* of seeing things, or other methodical ways of thinking, all aimed specifically *both* at overcoming our *intellectual way* of relating or orienting ourselves to our surroundings, *and* at our coming to know our “way about” (1953, No. 123) within the unique concrete situations that bewilder us. And as we explore the unique qualities of our initial bewilderments, we can come to feel so “at home” within them, he suggests, that we can come to see specific *possibilities*, previously unnoticed, for being able “to go on” (No. 151) within them, thus to guide our next steps in terms of the degree to which they satisfy the disquiets they initially aroused within us.

He thus describes the “turn,” or the change in attitude he intends here, as being of the following kind:

When philosophers use a word—“knowledge”, “being”, “object”, “I”, “proposition”, “name”—and try to grasp the essence of the thing, one must always ask oneself: is the word ever actually used in this way in the language-game which is its original home?—What we do is to bring words back from their metaphysical to their everyday use. (1953, No. 116)

For, as Wittgenstein sees it, when used in metaphysical (or theoretical) statements, divorced from their everyday surroundings, words have no determinate sense whatsoever. They are like the meaningless terms in Lewis Carroll’s poem, “Jabberwocky,” in which what sense such words as *brillig*, *slithy*, *toves*, *wabe*, *mimsy*, and so on have is only given them by their *syntactical place within well-known sentence structures*.

Yet, within their everyday use, our words *can* in fact be given precisely determinate meanings. How do we do this? How can we give an account of the organized sequence of tasks that we undertake in achieving such precise meanings? This is where—after having asked us to remind ourselves of a number of simple activities within which words are actually used to bring off a number of particular practical achievements—Wittgenstein’s introduction of the prospective, open, or descriptive concept of language games becomes so important. For it can give us a stable point of entry—a pivot point that “stands fast” (1969, No. 116) for us in our inquiries—to which we can return time and again, *and in relation to which* we can begin to differentiate and thus to organize the otherwise bewildering complexity of our first impressions.

Thus, rather than providing us with an alternative set of surroundings—a textbook framework or theoretical model into which to insert our data in making sense of them—Wittgenstein (1953) introduces different language games for very different reasons. He outlines them as follows:

Our clear and simple language-games are not preparatory studies for a future regularization of language—as it were first approximations, or idealizations, ignoring friction and air-resistance. The language-games are rather set up as *objects of comparison* which are meant to throw light on the facts of our language by way not only of similarities, but also of dissimilarities. For we can avoid ineptness or emptiness in our assertions only by presenting the model as what it is, as an object of comparison—as, so to speak, a measuring-rod; not as a preconceived idea to which reality *must* correspond. (The dogmatism into which we fall so easily in doing philosophy.) We want to establish an

order in our knowledge of the use of language: an order with a particular end in view; one out of many possible orders; not *the* order. To this end we shall constantly be giving prominence to distinctions which our ordinary forms of language easily make us overlook. (1953, Nos. 130–2, original emphasis)

They are thus orientational devices, aimed at reminding us of what to attend to in our inquiries. And one could almost say that Wittgenstein's main method of investigation is manifested here: In taking it that "every sentence in our language 'is in order as it is' . . . [and that] where there is sense there must be perfect order. So there must be perfect order even in the vaguest sentence" (1953, No. 98), he is asking us to look around within the everyday situations of actual language use, to notice why *this* or *that* utterance is structured as it is. For, as he sees it, the reasons for its structure, its "shape," are to be found out there, within its particular, moment-by-moment unfolding *relations* with its actual surroundings.

Conclusions

The results of Wittgenstein's (1953) investigations are, thus, not to be found on or in the pages of his writings, but in ourselves as readers of them. In our reading of them, we encounter dramatic vignettes aimed at re-orienting us, at changing us in the kind of investigators we can be. Their effects are manifested in the many different possibilities we can in fact see (and hear) being played out in the situations of our inquiries—they can *prepare* us to attend to *evidence* manifested in the *relations* between the events happening out in the world before us, evidence that we might not otherwise notice. His concern, then, is not to arrive at final, general answers for all time, but to help us to be clear about what we—as participants within *the situation of our current research inquiries*—are actually doing, and why we are doing it. And if a critic exclaims: "But in that case we never get to the end of our work!," he replies, "Of course not, for it has no end . . ." (1981, No. 447)—for our aim in his kind of qualitative research would be simply to achieve a particular practical result in a particular practical situation.

Wodak, Ruth

MIGUEL PÉREZ-MILANS

Ruth Wodak was born in London on July 12, 1950, with Austrian citizenship. She studied at the University of Vienna (BA in Slavic philology, Eastern European history and linguistics, 1970; PhD in linguistics *sub auspiciis praesidentis*, 1974; postdoctoral degree [habilitation] in applied linguistics, 1980), where she was assistant professor of linguistics (1975–83), associate professor of sociolinguistics and psycholinguistics (1983–91), and full professor of applied linguistics (1991–2004). She has been distinguished professor and chair in discourse studies at Lancaster University since 2004.

The significance and importance of Wodak's professional career is reflected in her various academic positions as well as in the number of prizes she has been awarded. Regarding her academic activities, she has been codirector of the Austrian National Focal Point (NFP) of the European Monitoring Centre for Racism, Xenophobia, and Anti-Semitism (now renamed European Union Agency for Fundamental Rights—FRA) as well as chair of the Panel of the Humanities and Social Sciences for the EURYI Award, European Science Foundation. She has also acted as a member of advisory boards of different institutions, including the Institute of Textbook Research (Vienna), Centre of Austrian Studies (New Orleans), Leo Baeck Institute (London), Simon Wiesenthal Institute (Vienna), Hanadiv Foundation (London), and ACCEPT Project (7th EU Framework).

In 2009, she was elected as president of the *Societas Linguistica Europea* followed by her nomination, in 2010, as honorary doctorate by University Örebro (Sweden) and as member of the *Academia Europea*. In addition to various other journals across different disciplines, she has been part of the editorial board of *Language and Education*, *Applied Linguistics*, *Language Policy*, *Language in Society*, *Journal of Language, Identity and Education*, *Journal of Linguistic Anthropology*, *Qualitative Research Quarterly*, and *Discourse and Communication*. She has also coedited various journals (*Discourse and Society*, *Journal of Language and Politics*, and *Critical Discourse Studies*, among others) and book series (*Language and Context*, *Discourse Approaches to Politics, Culture and Society*, and *Document Design*, among others).

With regard to the many prestigious prizes awarded to Wodak, these include the Prize of the Austrian Medical Society (1989), the Dr. Hertha Firnberg National Award (1990), the Wittgenstein Prize for Elite Researchers (1996), the Scientific-Prize of the City of Vienna (2001), and the Woman's Prize of the City of Vienna (2006).

Wodak's main contributions are mainly located in the discourse studies (DS). In particular, she was one of the founders of critical discourse analysis (CDA), a field influenced by the work previously done in the philosophy of language, the Frankfurt School, and by poststructuralist critics of social science. In this regard, Wodak's work needs to be framed within the shift in the structuralist conceptualization of language, from a decontextualized neutral system to a social practice. She has then focused on the importance of considering the context of language use, which means that describing discourse requires considering a reciprocal relationship between the communicative organization of a particular event and the situation(s), institution(s), and social structure(s) that frame it (Fairclough & Wodak, 1997).

According to this view, doing CDA implies an understanding of discourse as socially constitutive and socially conditioned in that it

constitutes situations, objects of knowledge, and the social identities of and relationships between people and groups of people. It is constitutive both in the sense that it helps to sustain and reproduce the social status quo, and in the sense that it contributes to transforming it. (Fairclough & Wodak, 1997, p. 258)

In this framework, Wodak has devoted herself to distinguish the meaning of “discourse” in linguistically inspired DA as opposed to Foucault’s formulation of “power-knowledge.” Thus, she has emphasized the need to understand “discourse” as structures of knowledge manifested in different kinds of (oral/written) genres and texts that have their own communicative conventions (i.e., linguistic features and organization) and ways of implying meanings. From this angle, texts are considered to create sense and shared knowledge and therefore are linked to each other, but also are connected to particular audiences; that is, there is a need for a dialectic relationship between producer and reader, so every text need to be contextualized and embedded in the sociopolitical context, the setting, and the genre (Wodak & Krzyzanowski, 2008). Indeed, she has explored a range of different settings and genres in context, which include her early analysis of courtroom interactions, therapy groups, news, and legal texts (see Wodak, 1976, 1981; Lutz & Wodak, 1987).

Apart from her elaboration of the notion of “discourse,” Wodak’s work has also played a fundamental role in the definitions of the scope, needs, and limits of CDA. She has stressed the necessity of considering CDA as a paradigm that, while being nonunified and multifaceted in terms of theoretical and methodological approaches, shares (a) the view on language as social practice, (b) the aim of producing both enlightenment and emancipation by creating awareness in social agents of their own needs and interests, (c) the understanding of “power” as a central condition in social life that is manifested and challenged in language, and (d) the interest in the intersections between power, history, and ideology so as to analyze processes of production, naturalization and challenging of unequal power relationships in the making and breaking of conventionalized, stable discursive practices (see Wodak, 1989).

Together with her former colleagues and PhD students in Vienna (Rudolf de Cillia, Gertraud Benke, Helmut Gruber, Florian Menz, Martin Reisigl, Usama Suleiman, Christine Anthonissen), Wodak has developed the so-called “Vienna School of CDA,” which has elaborated the discourse historical approach (DHA) since the 1990s by implementing an interdisciplinary, problem-oriented analysis focused on the change of discursive practices over time and across various institutional settings and genres (see Wodak, 2001, for further details). In this sense, she has been strongly committed to the combination of theoretical research and empirical analysis of large data corpora. The DHA has been expanded by Wodak in a number of studies articulated around the main research areas of theoretical-methodological perspectives in DS, prejudice and discrimination, language and/in politics (national and transnational; individual and collective) identity politics, and gender studies.

Concerning the theoretical-methodological perspectives, she has combined ethnography, pragmatics, argumentation theory, rhetoric, multimodality, and systemic functional linguistics as a way to approach discourse (see Wodak & Meyer, 2001; Weiss & Wodak, 2003; Wodak, 2007a). In her own words:

the concrete analysis should take into account historical developments of discursive practices (change), intertextuality, and interdiscursivity. This might explain why it is so difficult to provide “short, telling” examples in a paper: an example needs the deconstruction of the whole social-political and historical context in which the discursive practices are embedded. This approach . . . explains why interdisciplinarity is a necessity when undertaking CDA. (Wodak, 2002, p. 12)

In fact, her claims on interdisciplinary approaches, together with her use of ethnography and of large data samples as a consequence of her background in sociolinguistics, makes her definition of context a nonrestricted one, which allows it to overcome some of the criticism that has been made of other CDA researches.

In relation to prejudice and discrimination, Wodak has focused on the discursive construction and legitimization of old and new racism, xenophobia, and anti-Semitism in Europe. Particularly, her work has provided a great insight into how such exclusionary processes are built up and naturalized through the management of certain textual and visual elements (i.e., pictures, personal pronouns, lexical choice, argumentation and causalities, implicatures, syntactic embeddings) and in accordance with the changing historical conditions of given contexts (see van Leeuwen & Wodak, 1999; Wodak & van Dijk, 2000; Reisigl & Wodak, 2001; Wodak, 2007b). In this regard, her work has shown that, rather than disappearing, the traditional ways of social discrimination have changed into new and more subtle and ambivalent forms that need to be studied in the context of the local impact of new global migrations and neoliberal economic processes. The changing racialization of the subject, in which the skin color and physical signs of racial differences are less important than key symbols such as “the veil and the scarf,” or the “denial of racism” as a frequent disclaimer introduced to justify social exclusion measures, need thus to be framed within such a context (Wodak, 2010).

As to the research area of language and/in politics, Wodak has done extensive work on parliamentary discourse in Europe by analyzing the daily discursive mechanisms by which politics are organized in transnational, national, and regional arenas (see Wodak, 2009, for a detailed critical ethnography of the orders and disorders of discourse in the European Parliament). Within this area of enquiry, she has paid special attention to the developments in the discursive construction of Austrian national identity under the influence of political processes inside and outside Austria. Particularly, her analysis has allowed an identification of how issues of common past, present, and future, as well as common culture and territory, are (re)constructed through discursive strategies of intertextuality and recontextualization (i.e., by considering discourses in different political/media publics and everyday discourses standing in reciprocal relation to one another), in connection with the socio-political changes that have taken place in contemporary Austria within the context of its EU membership (see Wodak, de Cillia, Reisigl, & Liebhart, 2009, for further analysis). This line of enquiry has then shed light on the extent to which there is no such thing as one essential/homogenized national identity in any context, but rather different identities being discursively constructed according to the local socioeconomic and political conditions, which in turn helps to reconcile the old agency/structure dichotomy by taking into account social change.

With reference to gender studies, Wodak has contributed to the existing literature on the understanding of gender as context-dependent. In the framework of the different claims made about women and men, in connection with the development of gender studies in social sciences (see Kotthoff & Wodak, 1997, pp. 1–20, for a critical overview of the different implicit ideologies about gender underlying the different traditions historically developed in gender studies), she has then focused on the study of the discursive processes of socio-cultural construction and naturalization of differences assigned to gender/sex in everyday life and their influence on the production and legitimization of social inequality (Wodak & Schulz, 1986; Kotthoff & Wodak, 1997). In particular, her work has helped us rethink of gender/sex as a social construct that cannot be isolated from the relationships between social norms/evaluations, power structures, and processes of socialization:

it is more coherent to talk of gender as the understanding of how what it means to be a woman or to be a man changes from one generation to the next and how this perception varies between different racialized, ethnic, and religious groups, as well as for members of different social classes. (Kotthoff & Wodak, 1997, p. 4)

Ruth Wodak is considered to be a leading scholar in the area of applied linguistics, more broadly, and in the field of DS, more specifically. She is also perceived as a public intellectual in Austria. In this regard, she has always stated that, rather than staying in the “ivory tower,” she prefers to position herself with her research on anti-Semitism, racism, and right-wing populist rhetoric (see Kendall, 2007, for a detailed interview conducted with Wodak).

Word Associations

TESS FITZPATRICK

Probably the most pervasive metaphor used in relation to the mental lexicon is that of a network. The nodes of the network are seen as representing words, and the lines linking them are the connections between those words. Word association research is particularly consistent with this metaphor, and it is used in applied linguistics to investigate the nature of interlexical connections and the factors which might influence them.

Word-association data have two features which make them particularly valuable to lexical research. In a typical word-association task, an individual is presented with a series of cue words (also referred to as stimulus or prompt words), and is asked to respond with the first word that comes to mind. The resulting data have advantages both over naturally produced language in which the choice of lexical items is restricted by considerations of discourse, style, and syntax, and over many forms of experimentally elicited data, which are often limited to specific predetermined structures or words. By removing these confounding influences of text structure or test targets, the researcher is able to view more directly and more globally the structure of the individual's lexicon. The second feature stems from the spontaneous nature of the task; participants are asked to give an immediate, rather than a considered, response to each cue, the implication being that this spontaneous response will reflect the strongest, or most salient, or most automatic link from that cue word. Word-association tasks, then, have the potential to provide information about the mental lexicon by exposing lexical connections in a relatively unconstrained way.

Word-Association Research Design: Procedures, Cue Words, Response Categories

Word-association studies appear in the literature of psychological, sociocultural, and psycholinguistic as well as applied linguistic research, and approaches to word-association research are informed by paradigms from these various disciplines. In all these contexts, though, the design of a word-association study requires the researcher to make certain decisions regarding task instruction, selection of cue words, and categorization of responses. The classic word-association task originated in the field of psychology and requires the participant to provide a single-word response to each cue. The format for this might be spoken, written, or computer mediated. In order to address some more linguistically oriented research questions, though, variations on this task may be used. Some studies (e.g., Kruse, Pankhurst, & Sharwood Smith, 1987; Albrechtsen, Haastrup, & Henriksen, 2008) require subjects to provide multiple responses to each cue (12 and 2 respectively) and in their analyses differentiate between responses that are primary, secondary, tertiary, and so on. It is assumed in some cases that the primary response is more likely to be shared, whereas subsequent responses might be more idiosyncratic and therefore offer information about the lexical networks of an individual (it is easy to predict that most people's first response to *black* will be *white*, but less easy to predict subsequent responses). Others impose restrictions on the type of response to be given, for example by asking for interlingual responses (e.g., L2 responses to L1 cues), or responses in a certain grammatical class or with a specific

2 WORD ASSOCIATIONS

sort of link to the cue, such as superordinate (*car* > *vehicle*), similar (*car* > *automobile*), location (*car* > *garage*), and so on. Riegel and Zivian (1972) describe a complex study with associations restricted in these ways. A small but important number of studies reverse the conventional task, asking learners to identify rather than provide appropriate associations to a cue (e.g., Read, 2000, pp. 180–6).

Specific characteristics of cue words can influence response behavior in a number of ways. Some cues elicit a greater range of responses than others; Lambert refers to these as “provocative” cues (1972). Some studies have found that the word class of the cue will affect the word class of the response, with nouns most likely to elicit nouns, for example (Sökmen, 1993). Meara (1983) observes that highly frequent cue words are more likely to elicit predictable responses (e.g., *black* > *white*; *cat* > *dog*) than less frequently occurring cues. A lot of L2 word-association studies have used cues from the Kent–Rosanoff lists (1910). The words in these lists are highly frequent, and so encounter Meara’s problem of predictable responses, but the same characteristic makes them attractive for use with lower-level learners, who might not know less frequent words. The Kent–Rosanoff cues are also problematic because they were compiled in a linguistically unprincipled way, in order to elicit information about psychotic tendency rather than linguistic behavior. Several commentators have reviewed this problem and suggest alternative ways of compiling cue lists (e.g., Meara, 1983; Schmitt, 1998; Wolter, 2002; Fitzpatrick, 2006).

The third, and probably most challenging, decision to face the researcher is that of how to categorize, or measure, the response data. There are two basic approaches to this. The first approach assesses responses in terms of their stereotypy (or, conversely, their idiosyncrasy), and was traditionally used to investigate deviations from word-association norms in the L1 in relation to mental health and personality studies (e.g., Kent & Rosanoff, 1910). In L2 studies, learner responses have similarly been compared with responses on a list of norms, usually compiled from native-speaker data. Published norms lists include the Postman–Keppel lists (1970) and the Edinburgh Associative Thesaurus (Kiss, Armstrong, Milroy, & Piper, 1973), but researchers working with particular specifications or particular cue words often compile their own. In its most simple form, this sort of analysis entails learner data being awarded one point for every response which is also on a norms list (e.g., Randall, 1980). Some studies, though (Kruse et al., 1987; Schmitt, 1998; Wolter, 2002), have developed a more sophisticated, “weighted” scoring process which takes into consideration how high the response is on the norms list, and, in multiple-response tasks, whether the response was the learner’s first, second, third, and so on. Most often, studies which use a stereotypy measure are interested in how “native like” their participants’ response items are, and usually hypothesize that the more proficient a learner becomes, the more likely she or he is to give native-like responses. Although some findings indicate that this is, broadly, the case (e.g., Wolter, 2002), other studies are less conclusive, and consider the possibility that the relationships between words in the well-developed L2 lexicon will not necessarily be the same as in the L1.

The second approach to measuring response data stems from research into L1 lexical development. Early research into child-language development used a three-way categorization system for word-association responses, based on the Saussurian concepts of syntagmatic (horizontal) and paradigmatic (vertical) relations. Paradigmatic responses are those in the same word class as the cue, which could replace the cue in a structure without syntactic violation; syntagmatic responses are those which might be found in the same phrase as the cue and include, for example, collocations. The third category is clang responses, which share phonological or orthographic features with the cue, but are otherwise not related. This categorization system has been adopted by L2 researchers with varying degrees of success. Some studies (e.g., Söderman, 1993) suggest that as proficiency develops learners make fewer clang and syntagmatic associations, and more paradigmatic

Table 1 Three methods of scoring/categorizing responses to the cue word *window*

ones (thus mirroring L1 development), but there is contradictory evidence too, of syntagmatic links remaining well represented in proficient-learner and native-speaker responses (e.g., Albrechtsen et al., 2008). A number of commentators (Meara, 1983; Wolter, 2001) have questioned the practical applicability of this three-way categorization, pointing out that the categories are difficult to define and are open to interpretation. Several studies have developed these traditional classifications into a system of more precisely defined categories, with the aim of analyzing data in a way which is both more accurate and more informative (e.g., Sökmen, 1993; Fitzpatrick, 2006; Albrechtsen et al., 2008).

In order to demonstrate how different classification systems might operate, Table 1 gives examples (in column 2) of responses to the cue word *window*. The three right-hand columns indicate how these responses might be categorized according to a stereotypy measure, the traditional paradigmatic/syntagmatic/clang classification, and a more detailed system, similar to those used by Fitzpatrick (2006), Sökmen (1993), and others. Table 2 lists the most common English native-speaker responses to the cue *window* according to the Edinburgh Associative Thesaurus database (www.eat.rl.ac.uk/). The stereotypy score in Table 1 is based on these data.

What Word-Association Behavior Can Tell Us About the Lexicon

Viewing the lexicon as a network encourages exploration of the three dimensions of lexical knowledge proposed by Meara (1996). These are vocabulary size (or “breadth”), which equates to the number of nodes in the network; quality (or “depth”) of vocabulary knowledge, which equates to the quality or size of the nodes; and accessibility (or “structure”) of lexical information, which relates to the connections between nodes. L2 word-association data have been used to investigate all three of these dimensions. Regarding vocabulary size, the number of response words produced in a word-association test has been found to correlate with more global measures of language proficiency (Lambert, 1972; Kruse et al., 1987). This finding can be interpreted as suggesting that more proficient learners will have larger lexicons, and that more words can be produced as association responses from larger lexicons. The assessment of depth of knowledge has been directly addressed in the Word Associates Tests of Read (2000) and others, which require learners to identify (rather than to produce) associates of a target word. Wolter (2001) concurs with these research strands by acknowledging that his word-association study findings reveal information about both breadth and depth of knowledge. However, he claims that they also suggest a complex difference in structure between L1 and L2 lexicons.

It is probably in its capacity to reveal the sort of structural or accessibility differences described by Meara (1996) and referred to by Wolter (2001) that word-association research is most informative. The methodology varies, and interpretation of findings is often challenging but, gradually and incrementally, word-association studies are informing our understanding of both group and individual word-association behavior.

In most applied linguistic (as opposed to psycholinguistic) work, the groups investigated have been native and non-native speakers, and proficiency-based divisions of the latter. Stereotypy measures work on the straightforward assumption that learners will produce more typically native-like responses as their proficiency improves. This has been supported and refuted to varying degrees, for example with Albrechtsen et al. (2008) finding that more advanced learners produce more predictable responses (which they refer to as “canonical” responses). Studies which look at categories of response have found that clang responses occur more frequently in less proficient non-native speakers (Meara, 1983). The inference here is that phonological, or form-based, links are used to integrate words into the lexicon when they are in the early stages of acquisition, and before meaning-based links are well developed. Adult native speakers make almost no clang associations, at least with words they are familiar with. There is also some agreement that non-native responses are less predictable than those of native speakers, implying that the structure of the learner lexicon is less stable than its L1 counterpart, and that the nature and strength of connections in the L2 shift in response to changes in L2 exposure or proficiency (Riegel & Zivian, 1972; Sökmen, 1993). However, the association behavior of these groups in relation to paradigmatic and syntagmatic responses is rather more complex. Early studies of L2 word associations evolved from the observed differences in L1 child and adult association behavior, which focus on a “syntagmatic–paradigmatic shift” at around the age of 6. L2 researchers such as Piper and Leicester (1980), Söderman (1993), and Zareva (2007) have tested the hypothesis that acquisition of a second language will follow the same developmental pattern, and indeed have found that paradigmatic responses seem to occur more frequently in the responses of more proficient learners. Other studies, though, hint at a more complicated pattern of development, with Nissen and Henriksen (2006), for example, finding that Danish learners of English produced more syntagmatic than paradigmatic first responses in both their L1 and their L2. These investigations of word-association behavior by group (learner vs. native speaker) have, in sum, produced inconclusive findings. Certainly some broad behavior patterns have been discerned, but still many individuals produce truly idiosyncratic responses; it is exactly this phenomenon, of course, which promotes

the use of word-association data in psychology and psychoanalysis.

Recently, researchers have begun to move away from the notion of word-association behavior as a measure of proficiency, and view it as a means of enhancing our understanding of lexical processing and storage on a broader level. Three examples of these new routes of inquiry are: investigating the type of language experience which gives rise to network links; investigating individuals' association behavior in different contexts; using graph theory to explore the density of association networks. The first of these has been explored by Zareva (2010), who proposes that, because the language experience of L2 learners is fundamentally different from their L1 experience, we cannot expect the features of these two networks to mirror each other, even at the highest levels of proficiency. She proposes that the "multicompetent" L2 user develops lexico-semantic links which are, in their salient characteristics, distinct from links in the monolingual lexicons of the L2 or the L1. This represents a potential sea change in the perception of the dynamic trajectory of the learner lexicon. Second, Fitzpatrick has attempted to reconcile idiosyncratic individual behavior with group trends, by tracking individuals' word-association behavior longitudinally (2007). She observes a surprising amount of variation between respondents' association behavior, but also found that any single individual's associative behavior was stable over different test times, over different tasks, and even between their L1 and L2 (2009). The inference here is that individuals' association behavior, and by implication the way they store and access lexical information, is influenced by factors other than whether they are operating in their L1 or L2. Third, Wilks and her colleagues (e.g., Wilks, Meara, & Wolter, 2005) have attempted to replace metaphorical references to "networks" and "webs" with a quantitative measure of network density based on graph theory and operationalized through a simulation model. This has revealed new patterns of L1 and L2 difference, but also, like Fitzpatrick's studies, highlights the influence of individual differences on association behavior.

Word-association research occupies an unusual place in the field of applied linguistics. The term "word association" refers to a method, or an observed phenomenon rather than a theoretical notion, and matching theoretical constructs to the data which emerge from these studies has proved problematic. Progress in this field in terms of absolute findings has been hesitant, with many researchers abandoning this route of investigation after only one or two studies, but often with enthusiastic reference to the "promise" and "potential" (Schmitt, 1998; Wolter, 2002) of the role of word-association data in applied linguistics research. Recent moves to challenge the assumptions (from the literature on L1 development and L2 assessment) which directed much of the early research in this area are clearing a route toward realizing this potential.

WordNet

CHRISTIANE FELLBAUM

Introduction

WordNet (Miller, Beckwith, Fellbaum, Gross, & Miller 1990; Miller & Fellbaum, 1991; Miller, 1995; Fellbaum, 1998), a lexical database for English, can be thought of as a large electronic dictionary. It contains information about some 155,000 nouns, verbs, adjectives, and adverbs, including simplex words like *put*, phrasal verbs like *put up*, and idioms like *put out the dog*. Its digital format frees WordNet from the constraints of traditional paper dictionaries, whose entries have to be arranged according to their spelling (and thus, to some extent, their pronunciation). But since an important function of dictionaries is to inform users about word meanings, entries in WordNet are organized in terms of their semantics. Specifically, words in WordNet that are similar in meaning are interlinked by means of pointers that stand for a semantic relation. Formally, WordNet is a semantic network, an acyclic graph.

WordNet superficially resembles a thesaurus, in that it groups words together on the basis of their meanings. However, there are some important distinctions. First, WordNet interlinks not just word forms—strings of letters—but specific senses of words. As a result, words that are found in close proximity to one another in the network are semantically disambiguated. Second, WordNet labels the semantic relations among words, whereas the grouping of words in a thesaurus does not follow any explicit pattern other than meaning similarity.

Structure

The main relation among words in WordNet is synonymy, as between the words *shut* and *close* or *car* and *automobile*. Synonyms are grouped into unordered sets, dubbed “synsets.” Members of a synset are interchangeable in many but not all contexts; the criterion for joint synset membership is merely that the words denote the same concept. Each of WordNet’s 117,000 synsets is linked in turn to other synsets by means of a small number of “conceptual relations.” Additionally, a synset contains a brief definition (“gloss”) and, in most cases, one or more short sentences illustrating the use of the synset members.

Polysemy and Synonymy

Two features of the lexicons of all natural languages represent a challenge to human learners and automatic language processing systems alike. These are the one-to-many mappings of word forms and word meanings. A single word form expressing several meanings is a case of polysemy. Highly polysemous words in English are *check*, *case*, and *line*. Polysemy requires the reader or listener to identify the context-appropriate, intended sense of the word form.

When several different words all express (approximately) the same meaning, we have a case of synonymy (for example, {*car*, *automobile*, *auto*}). Synonymy poses a challenge for language generation: Which word expresses the intended concept most appropriately in

a given context? For example, both the expressions *empty dish* and *vacant vessel* refer to the same concept, but only the former is well-formed and clearly understandable.

WordNet represents synonymy straightforwardly in terms of synset membership. Polysemy is reflected in the different synsets that a word form occurs in; membership in n synsets means that the word has n meanings, or is n -fold polysemous. In this way, each form–meaning pair in WordNet is unique.

Relations

The most important relation among synsets is the super–subordinate relation (also called hyperonymy, hyponymy, or ISA relation). It links more general synsets like {*furniture*, *piece_of_furniture*} to increasingly specific ones like {*bed*} and {*bunkbed*}. Thus, WordNet states that the category *furniture* includes *bed*, which in turn includes *bunkbed*; conversely, concepts like *bed* and *bunkbed* make up the category *furniture*. The user can navigate within and across the resulting hierarchies, or “trees,” in either direction, from general to specific or from specific to general concepts. All noun hierarchies ultimately go up to the root node {*entity*}, as indicated in Figure 1. The hyponymy relation is transitive: If an *armchair* is a kind of *chair*, and if a *chair* is a kind of *furniture*, then an *armchair* is a kind of *furniture*.

WordNet distinguishes among types and instances. The latter include specific persons, countries, and geographic entities. Thus, while an *armchair* is a type of *chair*, *Barack Obama* is not a type but an instance of a president; similarly, *Zambia* is an instance of a country and the *Rhine* is an instance of a river. Instances are always leaf (terminal) nodes of WordNet hierarchies (Miller & Hristea, 2006).

Another important bidirectional relation is meronymy, the part–whole relation. It holds between synsets like {*chair*} and {*back*, *backrest*}, {*seat*} and {*leg*}. Parts are inherited from their superordinates: If a *chair* has *legs*, then an *armchair* has *legs* as well. Parts are not inherited “upward,” as they may be characteristic only of specific kinds of things rather than the class as a whole. Thus, *chairs* and kinds of *chairs* have legs, but not all kinds of *furniture* have legs.

Verb synsets are arranged into hierarchies as well; verbs toward the bottom of the trees express increasingly specific manners characterizing an event. An example is {*communicate*} – {*talk*} – {*whisper*}. The specific manner expressed depends on the semantic field; volume (as in the example above) is just one dimension along which verbs can be elaborated. Others are speed (*move–jog–run*) or intensity of emotion (*like–love–idolize*). Additionally, verbs describing events that necessarily entail one another are linked. Examples are {*buy*} and {*pay*}, {*succeed*} and {*try*}, and {*show*} and {*see*}. In each case, the event expressed by the first verb necessarily entails that expressed by the second verb, but not vice versa (Fellbaum, 1990).

Adjectives are organized in terms of antonymy (Gross, Fischer, & Miller, 1989; Miller, 1998). Pairs of “direct” antonyms like *wet–dry* and *young–old* reflect the strong semantic

Figure 1 A “kind-of” noun hierarchy in WordNet (excerpt)

contract of their members. The intensity of this relation is shown in the fact that they bring each other to mind, as reflected in association norms (see below for further discussion of the psychological inspiration for WordNet's structure). Additionally, Justeson and Katz (1995) showed that direct antonyms co-occur in the same sentence with far greater frequency than chance. Each of these polar adjectives in turn is linked to a number of "semantically similar" ones. Thus, *dry* is linked to adjectives including *parched*, *arid*, *desiccated*, and *bone-dry*. These adjectives are dubbed "indirect antonyms," as their relation to both the polar adjectives (*wet*) and its similar adjectives (*soggy*, *waterlogged*, etc.) seems less strong. Note also that direct antonyms modify the greatest range of nouns (*soil*, *weather*, *dishes*, *clothes*, and *lips* can all be both *dry* and *wet*), while indirect antonyms are more specific in their meaning and hence more selective of their nouns (*soggy*/**waterlogged bread*, *parched*/**arid throats*).

There are only a few adverbs in WordNet (*hardly*, *mostly*, *really*, etc.), as the majority of English adverbs are straightforwardly derived from adjectives via morphological affixation (*surprisingly*, *strangely*, etc.)

Cross-Part-of-Speech Relations

The majority of WordNet's relations connect words from the same part of speech (POS). Thus, WordNet really consists of four sub-nets, one each for nouns, verbs, adjectives, and adverbs, with few cross-POS pointers. Cross-POS relations include the "morphosemantic" links that hold among semantically similar words sharing a stem with the same meaning. Examples are *observe* (verb), *observant* (adjective), *observation*, *observatory* (nouns). Note that different senses of the verb (perception vs. religious observation) link to the adjective and the nouns (Fellbaum & Miller, 2003). In addition, in many of the noun-verb pairs the semantic role of the noun with respect to the verb has been specified. Thus, {*sleeper*, *sleeping_car*} is the LOCATION for {*sleep*} and {*painter*} is the AGENT of {*paint*}, while {*painting*, *picture*} is its RESULT (Fellbaum, Osherson, & Clark, 2007).

Where Do Relations Come From?

WordNet was initially conceived as a model of human semantic memory, inspired by theories that tried to explain how people can store and retrieve information about tens of thousands of concepts. An economic model is one where concepts and the words expressing them are organized into hierarchies. A concept at a given level in the hierarchy inherits all the properties from its superordinate (more general) concept; only the properties that distinguish a concept from its superordinate are stored with the more specific concept. Thus, we know that a canary can fly because we know that a canary is a bird and that birds can fly; but our knowledge that a canary is yellow is linked to the concept "canary" itself rather than inherited.

Hyponymy is not only an efficient way to organize words, concepts, and knowledge about concepts, but word association norms show that people store general and specific members of a given category in close proximity in their mental lexicon. An inspection of association norms—showing which words come to mind in response to a stimulus word—suggested many of WordNet's semantic relations (Fellbaum & Chaffin, 1990). Antonymous adjective pairs, such as *hot* and *cold*, have similarly been shown to be strongly associated with one another (Gross et al., 1989), inspiring WordNet's organization for this POS.

Adding More Relations

WordNet's organization is predominantly paradigmatic; that is, words from the same POS class are interlinked. But many mental associations are syntagmatic, that is, among words representing different POS that speakers frequently use together, such as *blue* and

sky and *sweater* and *knit*. Presently, contextual information about words is represented only in WordNet's definitions and illustrative phrases. In an effort to increase the connections among synsets in WordNet with additional links, Boyd-Graber, Fellbaum, Osherson, and Schapire (2006) collected thousands of similarity judgments ("evocation") between members of synonym pairs from speakers, regardless of the POS and without specifying the nature of the relation that was to be judged. The results showed that, in addition to the semantic similarities already recorded in WordNet, words that tend to collocate strongly evoke one another. Ongoing work on augmenting WordNet collects similarity judgments via controlled "crowd-sourcing" from anonymous contributors (Nikolova, Boyd-Graber, & Fellbaum, 2011). Eliciting the participation of hundreds of collaborators in this way constitutes an alternative to the labor-intensive manual construction of WordNet, which was based on the introspection of just a handful of linguists and lexicographers.

Crosslingual Wordnets

After the Princeton WordNet (www.wordnet.princeton.edu) gained widespread popularity, especially in the natural language processing community, wordnets were built in a number of different languages. EuroWordNet (Vossen, 1998) has words from eight European languages, including Estonian and Basque, which are genetically and typologically unrelated to Indo-European languages. An important goal was to connect all wordnets to one another, so that equivalent words and meanings could easily be identified. EuroWordNet took the Princeton WordNet as its hub. In some cases, the wordnet developers simply translated the English synsets into their language; in other cases, wordnets were initially built up independently and later merged with the English version. Not all languages lexicalize the same concepts, and for words that have no English equivalent a simple record was added to the English WordNet pointing to and from the language-specific words. In this way, the English WordNet became the union of all concepts lexicalized in all wordnets, but not shared by all. Consequently, the structure of EuroWordNet permits one to find equivalent words and meanings in all eight languages by going via the English WordNet, making it a valuable tool for crosslingual study and applications.

Currently, over 60 wordnets have been or are being developed worldwide, including entire groups of languages such as those in BalkaNet (Tufis, 2004), IndoWordNet (Narayan Chakrabarti, Pande, & Bhattacharyya, 2002), and African WordNet (Le Roux, Moropa, Bosch, & Fellbaum, 2007). The Global WordNet Organization maintains a list of wordnets (www.globalwordnet.org).

A related effort is MultiWordNet (Pianta, Bentivogli, & Girardi, 2002), a lexical database for Italian aligned with the Princeton WordNet. The MultiWordNet browser allows users to compare corresponding entries in Spanish, Portuguese, Hebrew, Romanian, and Latin wordnets and to examine lexical similarities and divergences in these languages.

Ontology

EuroWordNet first highlighted the need for a language-independent representation of concepts to which the lexicons (wordnets) of specific languages could be mapped. Using an actual language (like English) as the central hub is not the best solution, as it reflects the idiosyncrasies inherent in each natural language; in particular, wordnets that are developed by translating the synsets may inherit such biases (Vossen & Fellbaum, 2009; Fellbaum & Vossen, in press).

Concepts and their relations to other concepts can be represented in formal structures known as ontologies, which are precise and unambiguous and lend themselves to reasoning

and inferencing operations. SUMO (Niles & Pease, 2003) is one such ontology, and it has been mapped to many wordnets, serving as its interlingua (Pease & Fellbaum, 2009). Another ontology for wordnets of seven languages covering numbers of domain-specific terms has been developed in the context of the KYOTO project (www.kyoto-project.eu).

Applications

Information retrieval, document summarization, and machine translation are among the many applications that require machines to process natural language. Human language is amazingly complex and making it “understandable” to computers is a significant challenge. While automatic systems can segment text into words (or tokens), strip them of their inflectional endings, identify their part of speech, and analyze their syntactic (grammatical) function fairly accurately, they cannot easily determine the context-appropriate meaning of a polysemous word. Somewhat perversely, the words we use most often also have the greatest number of different senses.

Word Sense Disambiguation

WordNet’s organization of over 150,000 different English words into a huge, multidimensional semantic network makes it well suited for word sense disambiguation, as required by automatic applications. WordNet tells us, for example, that one sense of *check* is related to *chess*, another to *bank check*, and a third to *houndstooth*. On the assumption that words in a context are similar in meaning to one another, a system can simply navigate the paths connecting WordNet’s words and measure how close or distant a given word is from another in a text. Thus, if *check* occurs in the context of *draft*, WordNet will suggest that the appropriate sense of *check* here is *bank check*, as there only a few intervening nodes connecting the financial sense of *check* with (the financial sense of) *draft*, while there is a much longer (or no) path connecting *draft* and the textile pattern senses of *check*. Patwardhan and Pedersen (2003) offer a survey of WordNet-based similarity measures. Both within a language and crosslingually, WordNet has become a major tool for word sense disambiguation in numerous natural language processing applications. Increasing the internal connectivity of the semantic network by collecting and encoding human ratings of semantic similarity among words, as described above, will further improve automatic sense discrimination, as each form–meaning pair will have a larger number of unique connections to others and thus be more distinct and more easily discriminable from others.

Semantically Annotated Corpora

Automatic systems can learn linguistic features after being trained on data that have been manually annotated by humans and that constitute the “gold standard.” To improve sense disambiguation, selected words in the American National Corpus (www.americannational-corpus.org), a text collection of modern American English (Ide & Suderman, 2006), are annotated with WordNet senses (Baker & Fellbaum, 2008; Fellbaum & Baker, in press). The annotated corpus illustrates the use of specific word meanings for study and applications by both human users and computers, who can “learn” from examples to better identify context-appropriate word meanings.

Inferencing

A particular challenge for artificial intelligence and automatic text understanding is reasoning, that is, the ability to extract information that is implied but not explicitly stated in a text. Humans do this on a regular basis and have no difficulty inferring what language,

being parsimonious, leaves unexpressed. WordNet can contribute significantly to this effort via its semantic relations; thus, WordNet “knows” that *kill* entails *die* and that a *killer* is the agent of a *killing* event (Fellbaum, Clark, & Hobbs, 2008).

Other Applications

WordNet serves as a general lexicon to which domain-specific and technical terms can be added for the creation of a terminological database. WordNet is also used in linguistic and psycholinguistic research, as well as for language pedagogy (English as a first and second language). WordNet is the basis for software designed to help people with certain language pathologies such as anomia, the inability to retrieve words that the speaker wants to communicate. Here, WordNet suggests paths along which an anomic can “navigate” to arrive at the intended concept (Ma, Fellbaum, & Cook, 2010). Finally, WordNet has been integrated into many online dictionaries, including Google’s “define” function, that serve the broader public as a lexical resource. Being freely and publicly available, WordNet is queried tens of thousands of times daily and the database is downloaded some 6,000 times every month from the Princeton Web site.

Conclusion

WordNet offers multiple perspectives on the human lexicon—linguistic, psychological, and computational—and is a valuable tool for both theoretical and applied work.

Working Memory in Second Language Acquisition

NURIA SAGARRA

Working memory (WM) is the temporary storage and processing of incoming information needed to execute complex cognitive actions (Baddeley, 2007), such as processing a foreign language (L2). Since the 1980s, the role of WM in first language (L1) processing has been investigated extensively, but only more recently has its role in L2 learning been examined keeping in mind that adult second language acquisition (SLA) requires additional computation and activation, which in turn imposes extra load on the already limited WM resources. In particular, two memory components have been considered to play a prominent role in SLA: phonological short-term memory and WM's central executive, which is responsible for information management during processing. Our goal is to describe the theoretical underpinnings of WM's central executive, discuss tests to measure WM's central executive for L2 research, and provide a critical review of studies examining its role in L2 processing and learning. This issue is crucial for explaining individual differences in L2 learning, creating language-aptitude tests that predict L2 abilities, and implementing pedagogical practices that enhance verbal WM through trainability and compensate for WM capacity (WMC) shortcomings.

Working Memory Models

Of the numerous WM models that have emerged since the term was coined in the 1960s, the following are particularly popular within SLA circles: Just and Carpenter's domain-specific single-resource model, Baddeley's and Waters and Caplan's domain-specific multiple-resource models, and the domain-free connectionist models. Domain-specific models claim that limitations in WMC constrain L2 learning, whereas domain-free models rely on limitations imposed by a domain-general attentional construct. In turn, single-resource models emphasize a trade-off between processing and storage, while multiple-resource models assume that processing and storage are independent from each other.

Just and Carpenter's (1992) capacity theory posits that processing and storage depend on and compete for a shared pool of resources with a limited capacity that varies among individuals. Tasks that deplete a person's WMC can result in less storage and slower processing. This model differs from Baddeley's (2007) model that depicts WM as a multiple-resource system formed by a central executive and three slave systems with independent limited capacities: two short-term storage systems (phonological loop, visuospatial sketchpad) dedicated to a content domain (verbal and visuospatial respectively) and an episodic buffer that relays information between long-term memory and the phonological loop and visuospatial sketchpad. The central executive coordinates the flow of information between its slave systems, binds information from a number of sources into coherent episodes, determines what information is selected and inhibited, and decides when to shift between tasks or retrieval strategies. This polifacetic nature has led some scholars to propose separate resources within the central executive. For example, Waters and Caplan (1996) divided the verbal portion of WM into resources used in assigning syntactic structure and resources

employed in controlled verbally mediated tasks, and, unlike Just and Carpenter, assumed that WMC cannot affect syntactic processing efficiency.

Domain-free connectionist models do not differentiate between processing and storage and conceive WM as the general ability to control attention to maintain or suppress any type of information (verbal or not). Unlike domain-specific models, domain-free models do not see WM as a gateway to long-term memory, but as an activated part of long-term memory, involving short-term patterns of activation between domain-specific stores such as the phonological loop (e.g., Cowan, 2005). Also, WMC is not related to the number of items or chunks individuals can remember, but to their ability to control attention in the face of distraction. Therefore, the core of WM lies in activated long-term memory representations (capacity unlimited) and attentional control (capacity limited).

Working Memory Measures

To investigate the presumed relation between WMC and SLA, most L2 studies have employed a reading span test (RST), which combines processing with a concurrent storage task. In 1980, Daneman and Carpenter developed the first RST, which asked individuals to read increasingly longer sets of sentences aloud and recall the last word of each sentence in the set. Based on correct word recall, the results revealed that reading span significantly correlated with L1 comprehension. In 1996, Waters and Caplan modified Daneman and Carpenter's test to ensure semantic processing (it is uncertain how much semantic processing occurs while reading aloud) and to measure both processing and storage. In this test, participants read sentences silently, decided whether each sentence was plausible, and recalled the last word of each sentence in the set. The WM score was divided into mean RSTs for correct responses on plausibility judgments and word recall. The findings indicated that speed negatively correlated with both processing (sentence verification) and storage (word recall), but that processing and storage did not correlate highly. Scholars obtaining similar findings have claimed that processing and storage draw on different resource pools and should be scored separately (e.g., Logie & Duff, 2007). However, other scholars have reported a negative (Tosse et al., 2002) or positive (Barrouillet & Camos, 2007) correlation between processing time and word recall and defend the single shared attentional resource posture, thus, the single versus multiple resource pool is still an issue under debate.

Another controversy arises from how to measure verbal WM in low-proficiency L2 learners. Most SLA scholars have addressed this issue by conducting L1 linguistic span tests or nonlinguistic tests. On the one hand, L2 studies using L1 linguistic span tests assume that a cognitive system formed by as many "central executives" as languages spoken is unfeasible, and follow research showing a correlation between L1 and L2 RSTs within the same sample pool (e.g., Osaka & Osaka, 1992). The poorer performance in L2 than in L1 RSTs reported in some of these studies can be attributed to lack of L2 knowledge and is in line with both domain-specific models (WM effects are stronger in less developed processing systems) and domain-free models (lower-proficiency L2 representations are more susceptible to interference). On the other hand, there is considerable evidence that linguistic and nonlinguistic WM tests correlate with measures of verbal ability. Popular nonlinguistic WM tests involve reading a mixed sequence of numbers and letters and recalling first the numbers in numeric order and then the letters in alphabetic order (e.g., 7-c-3-a → 37ac; number-letter ordering test), solving a mathematical operation and remembering a word or a letter (e.g., $(2*3)-6 = 5$, dollar; operation span test [example of incorrect trial]), or listening to random digits and recalling them in reverse or forward order (backward/forward digit span test).

The next section shows that the use of various WM tests hinders a comparison between studies. This difficulty is accentuated by the small amount of studies reporting reliability measures and by methodological discrepancies. These include test administration (group vs. individual, entire test vs. partial test when word recall is insufficient to continue, computer vs. test taker), the processing task (reading aloud, sentence completion, grammaticality judgments, plausibility judgments), scoring (composite scores including processing and storage, separate scores for processing and storage, scores exclusively based on storage), grouping methods (median split, quartile split, all subjects), and statistical analyses (correlations, multiple regressions, ANCOVAs). Friedman and Miyake (2005) examined the use of the RST under different circumstances, and recommended that researchers score the test with continuous measures (total number of words recalled or proportion of words per set averaged across all sets) and avoid the creation of arbitrary groups (e.g., high vs. low span).

Working Memory and L2 Comprehension and Production

Understanding a foreign language is a cognitively demanding task involving L2 grammatical and lexical knowledge and controlled attention for constant updating of information. There is strong evidence that WM predicts L2 comprehension in adult learners (Alptekin & Erçetin, 2010). Harrington and Sawyer's (1992) seminal study with Japanese–English learners showed significant correlations between Daneman and Carpenter's RST in Japanese and the reading and grammar sections of the TOEFL (but no effects were obtained with an L2 reading, digit, or word span test). In another study employing Daneman and Carpenter's test with ESL learners, Abu-Rabia (2003) found that WM correlated with L2 reading and creative writing, and with the ability to process referents of distant pronouns. In contrast to these studies, Taguchi (2008) and Chun and Payne (2004) also used Daneman and Carpenter's test but found no WM effects on either L2 English comprehension of conversational implicatures or L2 German reading comprehension and vocabulary acquisition respectively. The lack of effects could be due to methodological variations of the original RST (e.g., Chun & Payne's participants checked which sentence-final words had appeared in the preceding set instead of recalling the words themselves) or to how Daneman and Carpenter measured processing (reading aloud does not ensure semantic processing).

Other studies that used Waters and Caplan's test provide further evidence of its association with L2 comprehension. For example, Leeson (2007) used this test in the L1 with beginning English–Spanish learners and found that high-span learners benefited from receiving a familiar passage and, when receiving an unfamiliar one, performed better on a form-recognition task than low-span learners. These findings indicate that, at low proficiency levels, topic familiarity affects L2 reading comprehension more than WM. In the same vein, Walter (2004) used the test in L1 and L2 and reported stronger correlations between the L2 RST and L2 summary-completion and anaphor-resolution tasks in lower-than upper-intermediate French learners of English. Although some researchers claim that span–comprehension correlations are due to the WM RST's similarity to comprehension itself, numerous studies have associated WM span tests with a myriad of cognitive tasks, as well as L2 production.

For example, Fortkamp (2007) investigated the relationship between WMC and L2 fluency. Results revealed that higher-span Portuguese–English learners were more fluent, accurate, and complex in L2 production, and that fluency, accuracy, and complexity of speech were achieved at the expense of weighted lexical density, suggesting a processing–storage trade-off. In the same line, Kormos and Safar (2008) reported a significant correlation between an L1 reverse-digit WM span test and the reading, listening, speaking, and

use of English sections of the Cambridge First Certificate exam. Similarly, Payne and Ross (2005) found a connection between an L1 RST, L2 oral proficiency development, and the frequency of repetition and other patterns of language use in chatroom discourse.

Finally, WM has also been associated with L2 writing performance. For example, Bergsleithner (2010) found a significant correlation between the operation span test and performance on an L2 written task, and Adams and Guillot (2008) reported an association between verbal WM and vocabulary and between spelling and phonological short-term memory. In contrast with these studies, Mizera (2006) did not find significant correlations between three WM tests (speaking span, math span, nonword repetition) and three measures of L2 oral fluency (speed of delivery, pause profiles, and morphosyntactic accuracy). He explains these findings by citing the complex nature of L2 speaking and personal and affective variables.

Working Memory and Processing of L2 Morphology and Syntax

Attention to meaning and form are necessary for SLA but attention to form is cognitively demanding. Just and Carpenter's single-resource model predicts that low WMC will reduce the resources available for sentence processing, whereas Waters and Caplan's multiple-resource model predicts no WM effects on sentence processing. Evidence of L2 studies using reading/listening span tests is mixed. For example, Miyake and Friedman (1998) reported that WM correlated with Japanese-English learners' comprehension and cue preference when processing L2 syntactically complex sentences. Similarly, Havik, Roberts, van Hout, Schreuder, and Haverkort (2009) found that WM predicted German-Dutch learners' L2 processing of short- and long-subject and object relative clauses (only the high-span learners preferred to process object as subject short clauses like native Dutch speakers). In another self-paced reading study, Dussias and Piñar (2010) concluded that Chinese-English learners and English native speakers showed subject-object parsing asymmetries when processing long-distance *wh*-questions, but that only the high-span learners resembled the English controls when using plausibility information to facilitate recovery from initial misparses.

While these L2 studies support a single-resource view, others point to a WM system comprised of separate resources. Juffs's self-paced reading studies (see Juffs & Harrington, 2011, for a review) revealed L1 transfer but no WM effects in how Chinese, Japanese, and Spanish native speakers processed garden-path, long-distance *wh*-movement, and temporarily ambiguous sentences in L2 English. Rodríguez (2008) also reported no relationship between WM and L2 processing of anaphoric reference, distance relative-clause resolution, and ambiguity resolution in Spanish and Chinese learners of English. Finally, Felser and Roberts's (2007) picture-priming study showed no WM constraints on how Greek-English learners processed *wh*-dependencies in the L2, even though WM modulated L1 processing in English native speakers. The lack of consensus on whether or not WM constrains L2 syntactic processing may be partially due to L2 proficiency, as studies showing WM effects had lower-proficiency learners than those claiming no effects (except Dussias & Piñar, but they only used an L2 RST and WM and L2 proficiency could be confounded). As shown below, L2 proficiency could also be one of the factors determining why WM has been found to modulate L2 morphological processing in some studies but not in others.

In a series of self-paced reading and eye-tracking studies that examine the relationship between WM and L2 processing of verbal (adverb-verb) and nominal (noun-adjective) agreement with English learners of Spanish, Sagarra (2008) and Sagarra and Herschensohn (2010) found that only higher-span beginning learners were sensitive to tense-agreement violations, and that higher-span low-intermediate learners were more sensitive to tense- and gender/number-agreement violations than lower-span ones, with the exception of the

number discord being less cognitively taxing than gender discord. While Foote (2011) reported no WM effects in L2 processing of subject–verb or noun–adjective agreement, her results could be due to her participants (advanced vs. Sagarra’s beginning/intermediate learners), scoring (words recalled vs. Sagarra’s composite score), statistical analyses (correlations vs. Sagarra’s ANCOVAs), and manipulation of distance between the agreement source and the target (distance increases syntactic complexity and Waters & Caplan’s claim that WM does not affect syntactic processing).

Working Memory and Attentional Control

As mentioned earlier, domain-free models consider the ability to control attention in the face of distraction as an integral part of verbal WM. Thus, WM has been associated with practices that encourage (a) simultaneous focus on meaning and form and a certain level of awareness (explicit instruction, intentional induction, recasts) and (b) intensive amounts of input (study abroad).

Explicit Instruction

Numerous studies show that explicit form-focused instruction is more effective than mere exposure to L2 input. Because explicit knowledge is subject to rule-based processing, which is conscious and controlled, some scholars (e.g., Roehr, 2008) suggest that it depends on the capacity limits of WM. Ando et al. (1992) reported that low-WMC learners benefited more from an instructional approach involving learner–learner interactions (implicit) than from form-focused production tasks (explicit). Also, Jaemyung (2010) found reactive effects of think-aloud protocols during rule learning among high- but not low-WMC learners. In contrast, Wright (2010) found no WM effects on processing explicitly taught knowledge and argued that WM may be a general “workspace” for both explicit and implicit knowledge.

Intentional Induction

Intentional generalization of morphosyntactic rules has also been linked to WM. For example, Robinson (2005) showed WM effects on grammaticality judgments produced by learners with high levels of awareness learning Samoan syntactic rules. Similarly, Kempe and Brooks (2008) found that high-WMC learners were superior at searching for nominal inflection regularities in known items in Russian than low-WMC learners.

Feedback on Error

WM constrains learners’ ability to switch attention between meaning and form during interactional recasts and to compare their output with a recast. This is important because correction and modified output help notice “the gap” between one’s own interlanguage and the target language. Mackey, Philp, Egi, Fujii, and Tatsumi’s (2002) study on question forms in English revealed that only high-WMC learners were able to notice recasts in the long run and that high WM was also related to more prolonged and delayed accuracy gains. More recently, Mackey, Adams, Stafford, and Winke (2010) found that high-WMC learners modified their output following interactional feedback more frequently than their low-WMC counterparts. Similar findings have also been reported in computer-mediated contexts. Sagarra (2007) showed an association between WM and target-like production and learner repair as long as two months after receiving computer-mediated oral recasts. Trofimovich, Ammar, and Gatlinton (2007) found WM effects on linguistic accuracy, but not on the ability to notice recasts; however, these discrepant findings can be explained by methodological differences and the absence of a delayed posttest.

Study Abroad

WM also determines how learners benefit from naturalistic settings, which contain great amounts of input, lack simplified input, and require rapid processing. Several studies confirm the relationship between WM, studying abroad, and L2 lexical production. Tokowicz, Michael, and Kroll (2004) and Sunderman and Kroll (2009) found that high-WMC learners were more accurate in a word-translation and a picture-naming task than low-WMC learners, and those high-WMC learners with more study-abroad experience surpassed high-WMC learners with less. The authors concluded that higher WM allows learners to better process multiple factors simultaneously, such as suppressing the L1 while attending to the L2. WM also constrains L2 morphosyntactic processing in study-abroad contexts. LaBrozzi (2011) reported that high-WMC study-abroad learners paid more attention to verbal morphology than low-WMC study-abroad and non-study-abroad learners. It is also noteworthy that the proficiency level of the participants in these studies is high; low-proficiency learners, still dependent on controlled processing, may have difficulty benefiting from studying abroad.

Conclusion

There is extensive evidence that WM is linked to the ability to control information from the environment that can be selectively enhanced or ignored. If WMC controls attention and attention is necessary for learning novel L2 input, could WM be the holy grail of SLA? Existing research suggests a close relationship between WM and L2 learning. However, there is still a great need for dissemination of scholarly research to answer several key questions: What is the neuroanatomy of WM when performing L2 tasks (Xue, Dong, Jin, & Chen, 2004)? What is the precise role of attentional control in SLA (Rai, Loschky, Harris, Peck, & Cook, 2011)? How does bilingualism impact WM (Hernández, Costa, Fuentes, & Vivas, 2010)? And what cognitive training practices increase WM and facilitate L2 learning (Klingberg, 2010)? A more nuanced understanding of the relationship between verbal WM and L2 learning will be achieved when future research delves into these issues.

Working Memory in Second Language Acquisition: Phonological Short-Term

ELISABET SERVICE

It is a common intuition that learning language is easier for some individuals than others. Empirical evidence from naturalistic and classroom learning contexts confirms that there is great variation in second language (L2) learning outcomes in both children and adults. Furthermore, such individual differences appear somewhat independent of general cognitive abilities. Individual personality and motivation as well as many environmental factors, such as type and intensity of input, are likely to be at play. A cognitively based theoretical construct that has shown promise for explaining a considerable portion of the variation in outcome is that of phonological memory. The first studies reporting a correlative relationship between memory for the spoken form of language and L2 acquisition were published at the end of the 1980s. The term *phonological short-term memory* (PSTM) is used to refer to the ability to form and maintain a mental representation of spoken material so that it can be immediately accessed and accurately repeated back aloud or silently rehearsed. In tests of phonological memory, accuracy is required at the phonemic level. Thus, in a repetition task, all speech sounds in a word, for instance, *cat* (/kæt/), have to be correctly reproduced. In contrast, phonetic features, such as the puff of air accompanying a word-initial /k/ sound produced by native speakers of English, need not be present. When material is presented in written form, PSTM refers to a representation specifying what its spoken form would be. The interest in PSTM in the context of language acquisition was born within the theory of working memory first put forward by Baddeley and Hitch (1974). This theory proposed that working memory, that is, the type of memory used for holding information needed in ongoing tasks, was composed of separable components. The researchers hypothesized one system for handling visuospatial material and another for verbal material. The two modality-specific systems were assumed to be controlled by a *central executive* component, supervising the information maintenance and manipulation functions of working memory. The verbal component, referred to as the *phonological loop* in later versions of the theory (Baddeley, 1986), is thought to consist of a *phonological store*, maintaining memory traces for phonological material, and an *articulatory rehearsal* process, actively refreshing these traces using a process based on inner speech. The term *phonological memory* is neutral to the distinction between ability to recall material immediately, that is, short-term memory, and ability to store language as permanent phonological representations of, for instance, words or word sequences. However, in the language-learning literature, “phonological memory,” “phonological short-term memory,” “phonological working memory,” and “phonological loop” are often used as synonyms.

Two longitudinal studies in the 1980s studied the ability to repeat back made-up pseudo-words that had the form of real words in a language but no meaning. Gathercole and her colleagues (Gathercole & Baddeley, 1989; Gathercole, Willis, Emslie, & Baddeley, 1992) found that pseudo-word repetition accuracy at four years of age predicted future first language (L1) vocabulary size in children up to the age of 8. Service and her colleagues (Service, 1992; Service & Kohonen, 1995) studied Finnish children from age 9 to 13 years. These researchers found that test performance over four academic years in English, taught

as a foreign language at school, was highly correlated with repetition accuracy for English-sounding pseudo-words. These two studies were interpreted within the Baddeley and Hitch framework to suggest that the efficiency of the phonological store plays a crucial role in determining individual differences in vocabulary development, in both very young children's L1 and older children's second/foreign-language (L2/FL) learning in school. A later study (French, 2006) addressed the language-specificity of PSTM resources. French tested 11-year-old Francophone children in Quebec, Canada, acquiring English as an L2 over an immersion period. This investigation employed Arabic words along with English pseudo-words in the repetition task. The predictive value of repetition performance with the words in an unrelated language was practically identical to that with the English pseudo-words, both predicting as much as 86.5% of the variance between individuals in a test of English developed by the province of Quebec.

A number of experimental studies have used short-term memory for relatively meaningless sequences consisting of digits, pseudo-words, or unrelated words to predict L1 or L2 learning. These studies produced similar results to those of studies based on repetition accuracy for single pseudo-words. Other studies (Papagno & Vallar, 1992), used learning of associations between objects, or familiar words, and novel word forms as a laboratory task to simulate real-world vocabulary acquisition. These studies found that phonological variables, such as word length and the similarity of the sound structure of a set of items, play a role in memory for vocabulary, supporting the hypothesis that it is a phonological component of working memory that is involved in the process of learning new names or translations for words in L1.

Not all studies have found clear effects of PSTM on L2 acquisition measures. Several studies suggest that more advanced learners' progress in L2 is not correlated with measures of PSTM (e.g., Cheung, 1996). The study by French (2006) of Quebec children immersed in instruction in English reported that new L2 learning was correlated with PSTM only for the half of the sample that had lower L2 scores at the beginning of the immersion period. As the children in this study were all the same age, it strongly suggests that it is the level of proficiency that makes the difference rather than, or in addition to, age. Findings from L1 acquisition have revealed a similar picture, namely the relationship between learning and phonological memory skills decreasing with increasing language mastery (e.g., Gathercole et al., 1992). From the point of view of the struggling L2 learner, this may be good news. It appears that although poor PSTM can slow down initial L2 learning, it may not limit learners in the long run.

Some studies with adolescent and adult participants have also reported null correlations between measures of PSTM and L2 learning. There are a number of factors that make the study of the relationship harder in adults than children. First, the task mostly used with children, namely pseudo-word repetition accuracy, is too easy for most adults. Individual variation between adults in this task is more likely to be related to either the familiarity of the language stimuli in the PSTM task (for instance, L1-based stimuli are easier than L2-based stimuli), or hearing acuity, rather than PSTM capacity differences. Second, the tested adult groups have also mostly been more heterogeneous in their motivation and language backgrounds, introducing powerful intervening variables that are hard to control for. Third, adult participants are more efficient learners in general and often highly skilled in using strategies that help them with laboratory models of L2 learning tasks. So far, at least two studies have reported substantial positive relationships between PSTM and L2 learning in adults. Hummel (2009) found repetition accuracy for Arabic words to be correlated with Francophone participants' learning of English in a university program. Majerus and his colleagues (Majerus, Poncelet, Van der Linden, & Weekes, 2008) were able to predict learning of English–French word pairs by English-speaking university students from scores in a short-term memory task in which participants reconstructed the order of

an auditory list of digits by arranging digit cards. However, further longitudinal studies with sufficiently homogeneous samples of adult participants are needed to determine under what circumstances PSTM may still play a role in adult acquisition of second/foreign languages.

Already early on, factors were identified that appeared to compensate for variation in PSTM in laboratory tasks mimicking L2 vocabulary learning. One such factor was the ability to associate the novel forms presented for learning with already familiar vocabulary in L1 or some other previously acquired language. This was first encountered in a study of Russian word learning by Italian and English participants (Papagno, Valentine, & Baddeley, 1991). The researchers found that Italian participants' learning of L1–Russian word pairs was impaired when rehearsal in PSTM was disrupted by constant repetition of an irrelevant syllable. This result was at first not replicated for English participants. It was, however, discovered that the Russian words were more easily associated with L1 words by English than by Italian participants. A new set of L2 words, now Finnish rather than Russian, was introduced. In the new experiment, learning was found to be impaired in connection with irrelevant articulation also in an English sample. These results were interpreted to suggest that the availability of semantic associations mediated by familiar words can support memory trace formation so that dependence on PSTM is decreased. A similar explanation is available for the finding that laboratory learning of more familiar items (pseudo-words based on the L1) shows lower correlations with PSTM than learning of less familiar items (words in an unfamiliar L2) (Service & Craik, 1993). Further research suggests that also visual memory support can lower demands on PSTM in experimental word learning (Duyck, Szmalec, Kemps, & Vandierendonck, 2003).

Most studies so far have specifically investigated vocabulary acquisition or L2 tasks in which performance is sensitive to how familiar the participants are with the vocabulary included in them. Thus, it has been hard to reliably separate vocabulary accumulation from the acquisition of other aspects of language, such as morphology and grammar. French and O'Brien (2008) studied English grammar learning in Francophone children. They carefully minimized the need for lexical knowledge in their grammar test. Their results revealed that PSTM, as measured by English pseudo-word or Arabic word repetition, predicted command of English grammar even when English vocabulary size was partialled out of the correlation. Replication of these results would strongly suggest that PSTM is involved not only in vocabulary acquisition but also in learning of L2 sentence structure.

Explanations of the mechanism that lies behind the repeatedly observed correlations between performance in PSTM tasks and language learning fall into two major categories: those that postulate PSTM as a causal factor driving language acquisition, and those that suggest that performance in PSTM tasks as well as language acquisition are determined by some other factor. The former hypothesis has most explicitly been argued by Baddeley and his colleagues (Baddeley, Gathercole, & Papagno, 1998), whereas Snowling, Chiat, and Hulme (1991) have pointed out that PSTM tasks, especially pseudo-word repetition, are likely to be affected by vocabulary size, thus turning around the direction of causality. A hypothesis describing a detailed mechanism (Metsala, 1999) involves a role for phonological processes in the analysis of novel word forms. According to this hypothesis, vocabulary growth forces finer tuning of phonological word representations, for instance in terms of phoneme rather than syllable units. This finer tuning helps pseudo-word repetition as well as memory for new word forms, which can be more easily encoded in phonemic detail. Recent studies suggest that the role of PSTM may be causal after all, in that a mechanism that supports memory for unfamiliar phonological sequences in PSTM tasks may also be involved in setting up representations of new word forms for later recall from long-term memory (Service, Maury, & Luotoniemi, 2007). Experimental data (Majerus et al., 2008), as well as computational modeling (Gupta & Tisdale, 2009), support

a theoretical position according to which learning of new language forms is aided by mechanisms involved in the creation of episodic representations of ordered phonological material (i.e., PSTM) as well as by preexisting phonological knowledge in the mental lexicon that is related to these new language forms.

World Englishes and Assessment

PETER LOWENBERG

In tests of English as an international language, the prevailing assumption has long been that the universal target for proficiency in English around the world is the set of norms for Standard English that are accepted and followed by highly educated native speakers of English in the countries of Braj Kachru's Inner Circle (B. Kachru, 1985), particularly Great Britain and the United States. However, over the past three decades, empirical research has demonstrated that in the countries of Kachru's Outer and Expanding Circles (B. Kachru, 1985), systematic and stable non-native norms for Standard English have been developing into *non-native varieties* of English (Lowenberg, 1986; Bamgbose, 1998; Y. Kachru & Smith, 2008). After providing a definition of Standard English that applies equally in the native-speaker and non-native varieties, this entry presents examples of non-native norms and then discusses implications of these norms for the assessment of English proficiency around the world. Due to limitations of space, this analysis will focus primarily on norms for Standard English at the levels of morphology and syntax.

Based on the work of Bautista (2000), McArthur (2002), Crystal (2003), Halliday (2006), and Jenkins (2009), Standard English from a World Englishes perspective is here operationally defined as the linguistic forms in a variety of English—native-speaker or non-native—that are regularly used in formal speaking and writing by speakers who have received the highest level of education in the country where that variety is used. These norms of Standard English are commonly used in what Sibayan (1994, in Gonzalez, 2004, p. 11) has termed the “controlling domains” of language use: official, legal, journalistic, and academic writing; public speaking before an audience or on radio or television; and as a medium or subject of instruction in education. (For a different position—that the British and American varieties still comprise the only internationally accepted and adequately codified norms for Standard English around the world—see Elder & Davies, 2006; Hamp-Lyons & Davies, 2008; Davies, 2009.)

At the levels of morphology and syntax, the many domains in which English is used with mutual comprehensibility in international communication among both native and non-native speakers indicate that Standard English differs only minimally across native-speaker and non-native varieties. Nevertheless, there are a few types of structures in which Standard English frequently does diverge across varieties, and these differences, as will be discussed below, can be very significant for the testing of English proficiency.

One such difference results from the conversion to countability of nouns that are not countable in all varieties, as in examples (1) through (4).

(1) *Inner Circle: Britain*

It's a nonsense to spend money on bed and breakfast when we could be buying homes.

(Algeo, 1988, p. 4)

(2) *Outer Circle: Philippines*

No. of Luggages

(“Daily Service Report,” Century Park Sheraton, Manila, 1996)

2 WORLD ENGLISHES AND ASSESSMENT

(3) *Outer Circle: Malaysia*

Thank you for upkeeping the equipments and facilities provided on this train.
(Permanent metal sign riveted to the interior of railway passenger carriages,
Malaysian National Railway, December, 1997)

(4) *Expanding Circle: Korea*

Although it is a hard work, I enjoy it.
(Shim, 1999, p. 252)

In Standard American English, all of the nouns in the underlined constructions in these examples would not be countable. (The noun *upkeep* used as a verb would most likely also be considered anomalous.)

Other differences occur in prepositional collocations and phrasal verbs, as in examples (5) through (8).

(5) *Inner Circle: Britain*

Man: I'm looking for the nearest post office.
Woman: There's one in St. Andrews Street.
(*Focus*, n.d., p. 17 [ESL course book prepared in collaboration with the Council of Europe], Zurich: Eurocentres)

(6) *Outer Circle: Singapore*

I live in an apartment at Belmont Road.
(The Straits Times Press, 1985, p. 177)

(7) *Outer Circle: Malaysia*

In conjunction of this, Hotel Lobby Decoration will be organized during the Floral Week.
(*Sunday Times*, Kuala Lumpur, Malaysia, n.d.; subsequently used in the 1997 General English Proficiency Examination at a leading Malaysian university)

(8) *Expanding Circle: Korea*

Gardens come on life again.
(Shim, 1999, p. 251)

In Standard American English, the correct prepositions would be *on* in (5) and (6) and *with* in (7). The correct particle in (8) would be *to*.

Awareness of these types of morphological and syntactic variation in normative features across the Three Circles is essential for evaluating non-native speakers' proficiency in English in the world context (Lowenberg, 2002). In order to assess this proficiency accurately, examiners must be able to distinguish *deficiencies* in the second language acquisition of English by Outer and Expanding Circle speakers from varietal *differences* in the speakers' usage resulting from their having learned such non-native norms as those discussed above (Lowenberg, 1993). An example of the importance of this distinction occurs in item (9), which is modeled on a test item in an ESL (English as a second language) placement test administered to international students at a major American university.

(9) Ms. Lee bought several new for her house.

- | | |
|------------------------|-------------------------|
| (a) piece of furniture | (c) pieces of furniture |
| (b) furnitures | (d) furniture |

Many educated speakers of Standard English in non-native varieties would have considerable difficulty in answering this question since they might find answer (b) quite acceptable. On the basis of “incorrect” answers on test items such as (9), international students in the United States who speak non-native varieties might receive scores underestimating their actual English proficiency and be erroneously forced to enroll in remedial ESL classes.

Speakers of Standard American English would probably encounter similar difficulties in attempting to choose the correct prepositions in items (10) through (12) from tests of Standard English proficiency in non-native varieties.

(10) *Outer Circle: Singapore*

The highest mark _____ the Mathematics test was 76 out of 100.

- (a) on (c) in
(b) at (d) for

(Practice Test #5 for the Primary School Leaving Examination, Singapore; distributed by Bookland, n.d.)

(11) *Outer Circle: Philippines*

The XYZ Commission is found in San Miguel Avenue in Pasig.

[task is to identify the incorrect constituent]

(from an English examination of a leading Philippine university, n.d.)

(12) *Expanding Circle: China*

Karaoke is very popular _____ (with, among) young people.

(Ministry of Education, 2000, p. 110)

According to the answer keys, the correct answer to (10) is *in*. The incorrect constituent in (11) is *in Pasig* (a district of Manila), the correct preposition being *at*, while the phrase *in San Miguel Avenue* is correct. No answer key is supplied for (12), an item that would perplex many speakers of Standard American English who would consider both choices acceptable.

The implications of this analysis are that tests of English proficiency meant to be used across all of the native-speaker and non-native varieties, such as the Test of English for International Communication (TOEIC), will be globally valid to the degree that they can focus on norms that are shared in all native-speaker and non-native varieties of Standard English, such as subject-verb agreement and the comparative and superlative forms of adjectives, rather than on the highly variable norms described above.

As noted at the beginning of this entry, due to constraints of space, discussion thus far has been limited to assessment of proficiency in the morphology and syntax of Standard English in the world context. In recent years, several scholars, including Canagarajah (2006), have cogently argued that tests of English as used internationally should focus much more on pragmatic, discourse, and genre features of Standard English. A contrast at these levels between native-speaker and non-native varieties in the domain of professional correspondence is evident in examples (13) and (14), from the United States and India respectively (Lowenberg, 2000, p. 79). Each of these examples contains the greeting and introductory sentence of a letter written to the same American professional inviting the addressee's listing in a biographical reference volume. In contrast to American norms for this genre, the Indian letter exhibits a marked embellishment that occurs frequently in many non-native varieties.

(13) Dear Professional:

Our editors have identified you as a biographical candidate for the forthcoming 23rd edition of WHO'S WHO IN THE SOUTH AND SOUTHWEST.

(Marquis Who's Who, Wilmette, IL, 1991)

(14) Dear Sir/Madam:

We come back upon the correspondence resting with the inclusion of your biographical-note in the forthcoming volume of our "Biography International" and thank you much indeed for your esteemed cooperation in sending to us the same. (Biography International, Delhi, 1986)

To date, identification of norms at these levels that apply across native-speaker and non-native varieties is extremely limited, impeding the development of valid international tests of communicative competence. However, continuing studies of cross-varietal contrasts in pragmatics, discourse, and genre, as well as in the many other lines of research on World Englishes explored in these volumes, should lead to the development of more comprehensive assessment instruments for use in the world context.

World Englishes and Language Pedagogy

AYA MATSUDA

The implications of the linguistic, cultural, and functional diversity of English to English-language teaching (ELT) have attracted much attention from scholars and teachers, and World Englishes studies have been the primary source of information and insights for responding to this interest. Starting with Braj Kachru's work in the late 1970s and early 1980s (e.g., 1976), articles and books have explored this topic, especially in recent years (e.g., McKay, 2002; Matsuda, 2003; Jenkins, 2006; Sharifian, 2009). Although the discussion so far has tended to remain at the abstract level, some classroom issues and questions have been recognized as crucial in teaching English in a way consistent with the language's sociolinguistic landscape today.

Instructional Variety

In most ESL and EFL classrooms, the "standard" varieties of English associated with the United States and the United Kingdom have traditionally served as instructional models. Recognition of other national and regional varieties as legitimate—a key contribution of World Englishes studies—questions this status quo and calls for the model selection based on various contextual needs, particularly on learner goals.

For instance, in some classrooms, a local variety of English may be more appropriate than the US or UK model. It particularly makes sense in many outer circle (i.e., former British and US colonies) contexts where "an *external* model does not suit the linguistic and sociolinguistic ecology" (Kachru, 1992, p. 61) and a nativized model of English has developed to meet the local communicative needs better (e.g., Llamzon, 1969; Bamgbose, 1992; Kachru, 1992). In the expanding circle too, Hino (2009), for instance, has argued for allowing English users to express indigenous values through their own version of English, just as the English users of the outer circle have localized English from the inner circle to better serve their communication needs.

In other cases, a "well-established" variety of English, which is codified, used for a wide variety of communicative functions, and relatively well accepted in various contexts, may be selected over a local variety. Various factors, including the goal of students, the availability of teaching resources, and a limited functional range of the local variety, may lead to such a decision. While American and UK varieties are likely candidates, they are by no means the only options. Other inner circle varieties (e.g., Australian English) and possibly several outer circle varieties (e.g., Indian English) may serve well, and when other outer and even expanding circle varieties become more established, they also become potential candidates.

Furthermore, recognition of linguistic diversity within English calls for awareness-raising regarding English varieties other than the predominant instructional model. This is especially critical to those learning English for the purpose of international communication because their future interlocutors' English is likely to be different from their own. The lack

of awareness and familiarity with diverse Englishes has been suggested to have potentially negative effects on students' attitudes toward other varieties of English and their confidence in successful communication involving multiple varieties of English (Matsuura, Chiba, & Fujieda, 1999), or even their ability to interpret interactions in various Englishes correctly (Smith & Nelson, 2006). Some of the ways to increase students' awareness of English varieties include exposing students to different varieties of English through teaching materials, providing opportunities for students to interact with English users from various backgrounds, and increasing students' meta-knowledge by making it a lesson focus (see Matsuda, 2006; Kirkpatrick, 2007; Matsuda & Friedrich, in press, for further discussion of the choice of model).

Communicative Strategies

Linguistic and discourse knowledge alone is not adequate for successful communication. Other necessary components of communicative competence include understanding of the *appropriate* use of the language and the effective use of strategies to sustain and enhance communication and to compensate for linguistic and other limiting factors (Canale & Swain, 1980). While this is true in any language, it is particularly so for English because English users today come from drastically different geographic, linguistic, and cultural backgrounds, and each participant brings his or her own frame of reference to the conversation. It is crucial that students are equipped with—and are aware of—both the linguistic and strategic repertoire they can draw on in situations where they use English to communicate with those who do not share their first language and culture.

Communication strategies that are particularly important given the linguistic and cultural diversity of English include the ability to derive meaning from context; to paraphrase, summarize, and engage in circumlocution; to ask for clarification of meaning; to aid verbal communication through nonverbal communication; and to display cultural sensitivity. Avoiding culturally specific expressions—or using use them effectively with proper glossing or explanation—is another important strategy in intercultural communication. In addition, knowing how to address miscommunication—preventively and responsively—is likely to contribute to successful communication.

Finally, students need to be reminded that communication is a two-way process. Making one's own message clear and trying to understand the other is not the sole responsibility of non-native speakers or speakers of "less standard" English varieties (however these are defined). Everyone is responsible for overall successful communication, whether it is international or not (see Matsuda & Friedrich, in press, for further discussion on communicative strategies).

Culture in English-Language Classrooms

Just like the instructional model, the cultural content of ESL and EFL courses typically focused on that of the Americans and British. However, recognition of the global spread of English significantly broadens the scope of "English-speaking culture." Even within the simplified concept of national culture alone, there are countries other than UK and US where English is used as the dominant language (e.g., Australia, New Zealand), multilingual countries where English has achieved official status and is used for limited but important functions domestically in tandem with indigenous languages (e.g., Singapore, Philippines), and those where English is learned for international communication and holds an important place in their formal education system. All contribute to the richness of English-speaking culture today.

Obviously, learning about all these countries in one course is not possible. One way to prioritize is to focus on the learners' use of English. For those learning English for domestic use, the focus may be the culture of the profession or speech community in which they will be using English. For those who need English for international communication, the course might touch on the countries of their interlocutors (if known), or several countries from each circle to help them understand the wide diversity and variation that exist among English-speaking countries. Global issues that cut across national boundaries, such as world peace and environment conservation, are also relevant for the function of English as an international lingua franca.

In addition, a learner's own culture is an important source of the cultural content (McKay, 2002; Matsuda, 2006). When English is used as the lingua franca, domestically and internationally, interaction will involve people from different linguistic backgrounds. In order to establish and maintain an equal, mutually respectful relationship through such interactions, the ability to express one's own values, opinions, and practices is crucial (Hino, 2009).

Teaching Materials

Few teachers have rich personal knowledge and experience with all the varieties and functions of Englishes that exist today. In order to effectively incorporate linguistic and cultural diversity into English classrooms, the availability of well-designed teaching materials is critical.

Traditional teaching materials, including textbooks, tended to focus on the UK and the USA because of the course's almost exclusive focus on varieties and cultures from these countries (Matsuda, 2002). However, more recent textbooks include explicit and implicit references to the kinds of diversity discussed above. For example, *Englishes of the World* (Yoneoka & Arimoto, 2000) and *Identity* (Shaules, Tsujioka, & Iida, 2004) feature people from different parts of the world and their varieties of English, and *Crown English Series II* (Shimozaki et al., 2004), a government-approved textbook for senior high school students in Japan, has a chapter entitled "Singlish Bad; English Good," which explicitly introduces the notion of World Englishes.

Teaching materials, of course, are not limited to published materials. Advancement in instructional media, including the Internet, is a great benefit for the development of teaching resources. For instance, English-language newspaper articles from the inner, outer, and expanding circles, easily accessed via the Internet, can be used as authentic reading material or as the base for a class discussion. Similarly, news clips available from broadcasting stations' Web sites or video clips from YouTube can expose students to audio samples of different varieties of English. Comparing and contrasting articles about the same topic or event published in different countries helps students understand the conflicting and competing perspectives that exist in the world. Analyzing different kinds of discourse from one country also exposes students to social, regional, and situational dialects—concepts that help them understand the complexity of the English language.

Assessment

The recognition of nativized varieties of English also challenges such notions as "standards" and "norms" and complicates proficiency assessment as well. For many English learners in the outer and expanding circles, complete convergence with the native speakers' norms is not necessary and sometimes even unwanted (e.g., Bamgbose, 1992). In such cases, the use of standardized tests based on the inner circle norm (e.g., TOEFL, Cambridge) may

not be appropriate because some legitimate and even standard usage in one variety may be considered incorrect in the variety on which these tests are based (Lowenberg, 2002).

One solution to this problem is to create a (standardized) exam locally, based on the local communicative reality, including the kind of English that is used, for what purpose, and with whom. In Indonesia, an English proficiency test for local English teachers was developed based on the local use of English, which predominantly involves interactions with speakers from outer and expanding circles in Southeast Asia (Hill, 1996). As Lowenberg (1993) points out, the assumption that native English speakers should determine the norms of English worldwide is neither possible nor appropriate; thus more tests similar to the Indonesian test need to be developed for different instructional contexts.

Another argument made in the area of assessment is to focus on effectiveness of use (e.g., Canagarajah, 2006). As stated above, English users are likely to find themselves in a communicative situation where multiple and conflicting expectations about what is appropriate and effective are found and negotiated. While grammatical accuracy certainly is helpful in such negotiations, and even highly expected in certain formal and professional contexts, that alone does not promise successful communication, as already explained. Assessment also needs to recognize this reality and address not only how *accurately* but also how *appropriately* and *effectively* one uses the language.

Critical Perspective

In addition to the inclusive representation of English varieties, speakers, and cultures, World Englishes research has provided further understanding of the politics of English, including such issues as language and power, the relationship between English and various indigenous languages, linguistic ecology, and the linguistic divide (e.g., Phillipson, 1992). While to what extent and how explicitly such topics should be addressed in the language classroom depends on each instructional context, it is important to empower all English learners with critical lenses that will allow them to use English effectively to meet their own needs and resist any oppression from the dominance of English, while respecting the needs of others (Canagarajah, 1999).

For example, students must understand that the variety they learn—or even English itself, for that matter—may not always be considered the most appropriate choice for a particular communicative situation. This is so because the appropriateness of language choice lies in the assumptions and expectations of members of the speech community and not in the language itself. In fact, it would be arrogant to think that whatever the language or a variety of language one knows is the most preferred choice by all, and English users need to approach the issue of language choice sensitively.

Advanced students can read, watch, discuss, and write about issues that are directly related to the politics of English or language in general. For example, in a classroom in Taiwan, topics related to local linguistic diversity and language policies or the possibility of Chinese becoming an international language would allow students to critically examine the relationship between language, culture, identity, and power in their own context, while gaining further understanding of their local culture.

Teacher Education

In spite of the increasing attention given to the implications for ELT, understanding of how World Englishes influence teacher preparation is fairly limited. This is unfortunate because changes in ELT cannot be implemented unless teachers themselves have a critical awareness of how English is used today. Because the language programs that pre-service

teachers have taken are typically inner circle-oriented, it is the responsibility of the teacher preparation curriculum to expose students to concepts such as World Englishes, linguistic imperialism, and language diversity.

Existing studies suggest that World Englishes research has much to offer to teacher preparation worldwide. Vavrus (1991) found that none of the 10 “reputable” MA programs in the USA he studied required a course that emphasized non-native varieties of English and that only two offer such a course as an elective. Matsuda (2009) found that, while many pre-service teachers in Japan were exposed to World Englishes at least to some extent and teacher educators often believe this is important, such exposure was still considered supplementary and secondary to Englishes, literatures, and cultures from the inner circle. Dogancay-Aktuna and Hardman (2007) also illustrated challenges in creating teacher education programs that are “re-imagined from a perspective that would no longer make narrow assumptions regarding the cultural/linguistic context of teaching, ESL-centric models of teaching, and the nature of the English language itself” (pp. 8–9).

An interesting development related to this area is the establishment of departments that are based on the World Englishes perspective (e.g., Chukyo University, Japan; Monash University, Australia). Although these programs are not exclusively about teaching, they often house a teacher preparation unit. Such an institutional set-up may facilitate more articulation between World Englishes and ELT than units with a more traditional approach to English studies.

Conclusion

Perhaps the most important insight that World Englishes studies provide to ELT is the understanding of linguistic, functional, and cultural diversity associated with the English language, and consequently the importance of context-based decision making. While the importance of context in language teaching has been recognized since the emergence of communicative language teaching and the concept of communicative competence in the 1970s (Berns, 1990), it is greater than ever in ELT today because of the global spread of the English language and the emergence and recognition of various forms and functions of English. People in different contexts learn different Englishes for different purposes and to different degrees, and thus the transferability of a curriculum and materials from one instructional context to another has decreased. This calls for a curriculum that is based on needs assessment, material development, and teacher preparation done locally. This approach to ELT may also foster an increased sense of local ownership of the language, which is a way to resist the dangers of the hegemony of English.

World Englishes and Teaching English to Speakers of Other Languages

AYA MATSUDA

Teaching English to speakers of other languages (TESOL) and World Englishes (WE) have both established themselves as important areas of inquiry within applied linguistics, with their own professional organizations (Teachers of English to Speakers of Other Languages and International Association for World Englishes [IAWE]), annual conferences, and affiliated journals fully dedicated to the scholarship in their disciplines (*TESOL Quarterly* and *World Englishes*, respectively). The articulation between the two fields, however, began only in the last decade or so, except for the work of a few individuals who crossed over the two areas (e.g. Kachru, 1976, 1984; Sridhar, 1994). This entry traces the history of the (inter)disciplinary relationship between the two fields as evident from scholarly publications that attempted to bring them together. It also identifies future research areas where cross-fertilization is particularly needed.

TESOL in World Englishes: Early Years

It is interesting to note that, in a way, the field of World Englishes became institutionalized and flourished the way it did because an early attempt to collaborate with TESOL had failed.

The conceptualization of the notion of World Englishes dates back to as early as the 1960s, but 1978 is an agreed point in a history when an organized scholarly effort to explore the global spread of English and its linguistic and functional implications was initiated (Kachru, 1997). This was the year when two independently organized conferences—one at the East-West Center in Hawaii and the other at the University of Illinois at Urbana-Champaign—were held to explore respectively the international and intranational functions of English across the world. These two conferences shared similarities in their goals and ideas, and the publications resulting from these conferences served as the foundation for the World Englishes studies.

Language pedagogy was one of the well-explored foci of World Englishes studies until mid-1980s. World Englishes scholars actively organized sessions at such language pedagogy conferences as TESOL, International Association of Teachers of English as a Foreign Language, and Georgetown University Round Table on Languages and Linguistics, introducing the discussion of World Englishes to the field of English-language teaching (ELT). Some of the publications during this period challenged the status quo and assumptions in ELT that were based on a monolithic view of English (e.g., Kachru, 1976, 1984), while others contributed perspectives that broadened and enriched the understanding of ELT in general (e.g., Sridhar & Sridhar, 1992; Sridhar, 1994).

In 1984, however, the fate of the relationship between two disciplines took a turn. At the TESOL convention, the board of directors rejected the proposal to create an interest section devoted to varieties of English around the world, and this rejection encouraged early World Englishes scholars to create their own space to explore these issues (Smith, personal communication, April 16, 2010; Kachru, personal communication, August 8, 2010).

While these scholars continued to participate in the above mentioned conferences, they also created an international committee for the study of World Englishes at the 1988 TESOL convention, and in 1992, the committee cosponsored a conference of "World Englishes Today" where the International Association for World Englishes was formally launched (Kachru, 1997).

From the mid-1980s through the 1990s, the primary focus of the newly established organization and the field it represented was the linguistic and functional description of English in different parts of the world. While language teaching remained a legitimate research focus, it seemed to have stayed in the back seat while an effort to establish the pluralistic nature of English drove the discipline. Among nine research areas of World Englishes identified at the conference "Language and Power: Cross-Cultural Dimensions of English in Media and Literature" in 1986, only one explicitly dealt with the issue of language teaching: "Comparison of contexts and methods of language teaching in diverse cultural and educational settings" (Kachru, 1997, p. 211). This positioning of language pedagogy topics was also evident in publication trends in *World Englishes*. When Braj B. Kachru and Larry E. Smith took over the editorship of the journal *World Language English* in 1985, they also changed the title to *World Englishes*, which signified the change in the focus of the journal. *World Language English*, with the title that recognized the use and status of English as a world language, focused on English-language teaching and learning in parts of the world and attempted to reach the broad range of English teachers and learners by publishing relatively short and accessible articles. The new title, *World Englishes*, suggested that the linguistic and functional variation and diversity of the language was going to be the focus and foundation of this journal. It was now a scholarly vigorous journal, featuring more full-length articles on sociolinguistics of Englishes in general. After this change, the number of pedagogy-related articles went down to one or two per volume, although many of them were now full-length articles.

In addition, among 20 issues identified in the survey of World Englishes research published in 1997, none specifically addressed English-language teaching (Kachru, 1997). It should be noted, however, that there was one category on teaching World Englishes and many others did mention their pedagogical implications in discussion. It seems fair to say that the last decade of the 20th century in World Englishes was devoted to the establishment of itself as a discipline, in which language pedagogy was considered a legitimate but not necessarily dominant focus of inquiry.

World Englishes in TESOL

As described above, the notion of World Englishes was present and visible in TESOL until the early 1980s. Furthermore, there were TESOL members, including James Alatis, the first executive director, who acknowledged the importance of the World Englishes perspective in ELT from the early days. However, what the story of the failed attempt to create a World Englishes interest section illustrates is that the global spread of English and the resulting diversity in forms and functions of English were not perceived as a critical issue in the field of TESOL as a whole then. The publication trend in *TESOL Quarterly*, established in 1967, suggests that it was probably the case until the end of the decade.

TESOL as an organization was established in 1966 out of the need for a professional group dedicated to teaching English to speakers of other languages. The organization and consequently its journal were meant to be international from their inception. The founding leaders were explicit about the needs for a global focus and deliberately chose not to include such terms as *American* or *National* as part of the title (Alatis, 1987). However, its focus in reality was American. Non-US contexts were positioned as foreign lands where

Americans would go and teach, rather than where a unique variety of English may be taught, learned, and used in a locally appropriate way. Consequently, articles from abroad published in *TESOL Quarterly* in the early days tended to be “state of the art” articles, introducing issues to be kept in mind when Americans teach there.

Topics covered in early issues of the journal mostly addressed classroom issues and teaching of “X,” where X could be something very specific (e.g., pronunciation of the “th” sound) to broad (e.g., writing, academic skills), reflecting the trend in the entire field. There were also many articles about surveys of other disciplines and their implications for TESOL. TESOL then was “at a stage in its development when it must actively solicit contributions from a variety of disciplines” (Wardbaugh, 1972, p. 291), and publication trends reflected such needs.

Issues related to the global spread of English and “new” varieties of English appeared in the literature as early as 1969 but only sporadically for the first two decades of the journal. Quirk (1969), in the first such article, acknowledged the existence of new Englishes but considered them as something that was in conflict with “the English of orthodox law-enacting, culture-bearing, education-disseminating” (p. 24) and thus a problem. Kachru (1976) introduced the idea of new Englishes as legitimate varieties of English and argued for a pluralistic view of English in ELT. It should be noted, however, that there was a rich discussion of teaching standard English to speakers of “nonstandard” dialects (e.g., African American Vernacular English) in the United States, and many sociolinguistic concepts that serve as the foundation of WE studies were introduced to the TESOL community during this period.

The absence of an entry on World Englishes in the 25th anniversary issues of *TESOL Quarterly* in 1991 is probably an indication that the topic was not acknowledged as a critical or possibly even legitimate in the field of ELT throughout 1980s. However, Brown (1991) did point out such facts as that “English is increasingly *not* learned as a tool for interaction with just *native* speakers of the language” and it “is *not* always learned as a tool for understanding and teaching US or British cultural values” (p. 250). He also acknowledged the major role the non-native English speakers were playing in the field of TESOL. The linguistic and functional diversity of English that resulted from the global spread of English, as well as its implications for teaching, was also mentioned.

From the end of the 1980s throughout the 1990s, there was a sudden increase in the number of articles that address questions related to World Englishes, often in relation to such topics as language and politics (e.g., Pennycook, 1989). There were some special issues devoted to topics that were very relevant to WE studies (e.g., language planning and policy in 1996; identity in 1997), and articles from non-US contexts often went beyond the description of an exotic land where native English speakers would go and teach but represented local perspectives that sometimes challenged Western assumptions (e.g., Burnaby & Sun, 1989). At the 1994 TESOL Convention, Braj Kachru gave the annual James E. Alatis plenary titled “The Paradigms of Marginality,” which critiqued the practices of linguists and language specialists that marginalized multilingualism and multilingual users, and argued for new views and attitudes toward World Englishes.

The increased awareness of the power politics in ELT, questions about the ownership of English, and the spread of English and its implications for variations and standards appeared not just in the TESOL organization but in ELT communities in both the United States and United Kingdom (Bowers, 1986). It seems that not only awareness and interest in globalization and World Englishes increased during this period but also the focus shifted in the discipline. The emergence of new topics and theoretical approaches (e.g., critical theory, language planning and policy) created a space for international perspectives and explorations of World Englishes to flourish within the discourse of ELT.

World Englishes and TESOL in the 21st Century

In the past decade or so, we have witnessed growing interest in bringing World Englishes and TESOL together, both in terms of scholarship and teaching practices.

In *World Englishes*, the number of articles with a pedagogical focus increased, especially in the early 2000s, including a symposium (a special theme section) devoted to the exploration of World Englishes and teaching English as a foreign language. In *The Handbook of World Englishes* (Kachru, Kachru, & Nelson, 2006), five out of six chapters in the section on “World Englishes and Applied Theory” directly addressed the implications of World Englishes to ELT around the world. Recent IAWWE conference programs included numerous invited and peer-reviewed presentations related to pedagogy, including a half-day workshop devoted to this topic in 2008.

The presence of the World Englishes perspective in TESOL has also become significantly more visible since the turn of the century. The TESOL Board of Directors approved the position statement on English as a Global Language in March 2008, which recognizes and appreciates World Englishes (Teachers of English to Speakers of Other Languages, 2008). *TESOL Quarterly* regularly publishes articles that explore the intersection of World Englishes and TESOL (e.g., Matsuda, 2003; Bruthiaux, 2010), although they may still “be the exception rather than the rule” (Jenkins, 2006, p. 158). The 40th anniversary issue of *TESOL Quarterly* included a chapter dedicated to World Englishes, which Suresh Canagarajah, the editor of the journal then, described as “risen to prominence after the [25th anniversary] issue, affecting almost all the other domains of language teaching” (Canagarajah, 2006b, p. 5). What is even more noteworthy is that references to World Englishes are made in articles with a focus on what are not typically considered “WE issues” (e.g., Murray, 2000, on computer-mediated communication). There seems to be an increased sensitivity toward linguistic diversity in English and a shared concern toward and increased awareness of such problems as the construct of native English speakers and the dominance of English, because of “[t]he growing interest in and increasing assertiveness on the part of proponents of native varieties of English” (Flowerdew, 2001, p. 140).

In addition to the number of articles and book chapters published in both fields, there have been book-length explorations that bring these two fields together, mostly focusing on the globalization and teaching of English for international communication (e.g., McKay, 2002).

One characteristic of recent work that draws from World Englishes and TESOL is that it goes beyond adding new knowledge within an existing framework for understanding these fields. While earlier contribution of World Englishes to ELT was mostly limited to the question of how (mostly linguistic) variations complicate (and enriches) ELT, recent studies call for a paradigm change in the way we think of ELT by updating our understanding of how English is used in today’s global world. From the pedagogical perspective, such a shift calls for a reexamination of assumptions and the status quo in language teaching practices. In scholarship, the new positioning of World Englishes as the foundation, rather than supplemental information, of how we think of ELT opened up new research areas and ways of thinking about various aspects of language pedagogy.

Some examples of areas where cross-fertilization is already occurring and especially relevant include questions related to the notion of intelligibility (e.g., Kachru, Nelson, Kachru, Bhatia, & Berns, 2008), standards and assessment (e.g., Lowenberg, 2002; Canagarajah, 2006a), non-native English-speaking teachers and teacher identity (e.g., Brutt-Griffler & Samimy, 1999; Dogancay-Aktuna & Hardman, 2008), sociopolitical awareness and language ideology (e.g., Phillipson, 1992; Canagarajah, 1999), and methods and curriculum (e.g., McKay, 2002; Brown, 2006). Theoretical concepts in SLA and related fields are also revisited with the insights from World Englishes (e.g., Sridhar & Sridhar 1992; Berns, 2006).

Conclusion

It is clear that the fields of TESOL and World Englishes have something to contribute to each other, and cross-fertilization is needed to understand and situate the practice of ELT in the global context.

In TESOL, insights from WE studies serve as the foundation and context for all ELT practices to be situated. Although such issues as the global spread of English and its linguistic and social implications may be more directly relevant to teaching in some contexts than others, they are in fact part of the reality that ELT addresses. For example, in English-language learner (ELL) programs in US schools, the curricular focus is on US language and culture. It is rightly so because the mission of such programs is to prepare students for the “mainstream” US classrooms. However, it is important for teachers in such programs to be aware of different varieties of English that exist in the world today because those are the Englishes that ELL students may have been exposed to in the past or will be in future. Similarly, unaware teachers may uncritically present one variety of English as the only correct variety of English—rather than one variety of English that is preferred in that particular context—and unintentionally degrade other varieties of English and speakers of such varieties of English. In that sense, our understanding of today’s English language should seep into every aspect of ELT, regardless of the geographic context, informing and influencing every aspect of TESOL research and practices.

In World Englishes, ELT continues to be one example of space where the notion of World Englishes is examined vis-à-vis the reality of English. Research that directly investigates the implications of World Englishes to ELT obviously addresses this interdisciplinary area of inquiry. But even with the cases of WE research projects that seem distanced from teaching—such as the linguistic analysis of Englishes or investigation of English use in advertisements and entertainment—information regarding the place of English in educational system provides great insights into the (socio)linguistic reality of English where the investigation takes place.

World Englishes and the Role of Media

ANJALI PANDEY

The link between World Englishes and media has gained in importance in the 21st century by the twin forces and effects of globalization. While media are inclusive of a plethora of written and broadcast formats, including but not limited to advertising, books and bestsellers, electronic games and software, fashion, the Internet, magazines, music, newspapers, radio, satellite television, tourism, video and DVD, the Web, and even sports (Miller, Govil, McMurria, Maxwell, & Tang 2005; McCrum, 2010), the primary focus of this entry is film, with some discussion of other media streams, with bestsellers increasingly emerging as filmic fodder in the era of media syncretization. To view media-making in the 21st century as neutral, entertainment-driven, and agenda-vacuous, as some researchers do, is to ignore the role and impact of the industry. In an era of globalization, media such as film are increasingly being viewed not as neutral tools of entertainment, but rather as “cultural commodities” (Miller et al., 2005, p. 42) produced for edutainment, while subverting a creative and aesthetic orientation eager to merge market interests with cultural and linguistic agendas (Bleichenbacher, 2008; McDonald & Wasko, 2008).

Why film? First, the role of film, particularly in the spread of inner circle World Englishes such as American English in the 20th century, has been pivotal, as is film’s current “supra-national momentum” (McCrumb, 2010, p. 269) in disseminating English in expanding circle domains such as China. Film is increasingly becoming universally accessible. Over 800 English language films are produced annually in Hollywood (Miller et al., 2005), with more English language usage emerging in films produced in outer circle markets such as Bollywood, with its own annual output of approximately 1,000 films (McDonald & Wasko, 2008). China and India alone account for “over two-thirds of film screens around the world” (Miller et al., 2005, p. 20). Film is also a tool of multiplex entertainment with “tie-ins” (Block & Cameron, 2002, p. 3) to bestsellers, commercial paraphernalia, and fast food franchises—a few from a multitude of options. Second, film as a tool for English-language teaching and learning in both classroom contexts (Winke, Gass, & Syderenko, 2010) and naturalistic settings (Cintas & Anderman, 2009) is increasingly becoming prominent, as is its use as a pedagogical tool permitting recursive linguistic practice (Seferoglu, 2008). Finally, film’s internal formal structure (narrative, textual, linguistic, aesthetic, and semiotic), as well as its external workings (the socioeconomics of production; McDonald & Wasko, 2008), are prototypical of the potential embedded in 21st-century media to utilize the sphere of pleasure to either preserve or quell the current linguistic diversity of World Englishes. To provide a coherent view of issues, we explore some key questions.

First, to what extent do current media represent the true diversity of World Englishes and to what extent do media include or privilege certain varieties of English while excluding or marginalizing others? In an era of globalization, an economic shift has given rise to the phenomenon of “runaway productions,” defined as locally marketed media products made “in another country” (Miller et al., 2005, p. 7). Another case in point is the successful global media syncretization projects of adapting local bestsellers into runaway global blockbusters—an increasingly popular trend which may or may not privilege local World English varieties. For globalization celebrationists, these scenarios have the potential of representation and inclusion of a plethora of *other* inner, outer, and expanding World

English varieties found in locales around the world. For skeptics, however, such outsourcing of “pleasure” has the potential to increase the “normalization” of “homogeneous values and practice” (Canagarajah, 2002, p. 136)—a privileging, so to speak, of a select number of inner circle varieties, in particular British and American English, often to the marginalization and exclusion of other outer and expanding circle varieties. McCrum, for instance, cites the “unipolar” world ensuing after the collapse of the Berlin Wall as a major factor in the media monopoly exerted by two varieties of World English, stating: “British and American English have now become the default position of the international media” (2010, p. 233). This linguistic exclusion is salient to some scholars who view such a linguistic monopoly as problematic, as reviving outmoded, “center-periphery” dichotomies in which the center as giver and the periphery as taker engage in an “unequal global ecumene of cultural interaction and exchange” (Hannerz, 1991, p. 66).

A related question: What effects in terms of status does such an asymmetrical screen rendering of different World Englishes have on global audiences? Put differently, what are the potential effects of such linguistic renditions in shaping viewers’ tastes and dispositions—in short, their linguistic *habitus*—for particular English varieties over others? The cultural and educational implications of such a differential weighting of World English varieties in the media are immense. The emergence of language as linguistic capital (Duchêne & Heller, 2007) has prompted some to report how “the commodification of language affects both people’s motivations for learning languages and their choices about which languages to learn” (Block & Cameron, 2002, p. 5), more specifically, which World English varieties to master and which to discard. Native speaker proficiency for some then becomes a “saleable product—a linguistic brand for export, like Burberry” (Holliday, 2009, p. 151). The short- and long-term linguistic effects of such media portrayals on World English teaching and learning preferences are in pressing need of careful and systematic analyses. Kuo (2006), for example, cites the case of her students who, while living in distant expanding circle domains remain eager to adopt target-like productions of inner circle norms—that is, British English. Where do such linguistic preferences come from? Can the media be implicated in such preferences? More large-scale research is needed in this area.

In Orwellian terms, are some inner circle varieties more equal than others? Which contextual factors determine how such World Englishes are rendered on the silver screen and in the media? The seeming global preference for inner circle varieties of World English over local varieties does not suggest that inner circle varieties are monolithically rendered in current media. More research is pointing to competition within economically powerful inner circle varieties for global media markets. Graddol (2006) cites numerous examples of media competition from other World English varieties, as well as media contests with rival national languages such as Arabic and Chinese. Growing competition is also emerging in media monopoly as China launches its own state-run English-medium channels. For some scholars, the massive rise of Internet-based media outlets, combined with rapidly spreading varieties of World English, are bound to render native speakers, and eventually native speaker pedagogical models, “irrelevant” (Saraceni, 2009, p. 177), since there are “now more non-native speakers of English than there are native speakers” (Kirkpatrick, 2009, p. 381). Consider India, purported to have “the largest English-speaking population in the world” with “350 million speakers”—“far more than the combined English-speaking populations of Britain and the USA” (Crystal, 2008, p. 173). In the face of such numbers, however, current media, like the sister industry of language teaching according to some, persist in exhibiting resistance to what Saraceni (2009) has labeled “the paradigm shift” (p. 176) currently at work in World English use—shifts from “purist positions” built on “monochromatic” (p. 175), exocentric models of native speaker proficiency to more “inclusive” (p. 176), polychromatic, endocentric-based models incorporating the dialect diversity inherent in World English use.

A related fourth question: How is such centering versus peripheralization of World Englishes actually construed in both filmic and linguistic terms within media such as film? In the face of the diverse global linguistic landscape, *how* World Englishes are linguistically and semiotically rendered via global media formats becomes an even more pressing issue (Bleichenbacher, 2008). Within the context of market controls of media, researchers such as Pandey (2010) contend that the global monopoly of endocentric varieties of English in media is a consequence of carefully orchestrated, semiotic, and discursive indexing on the part of media-making. Such approaches call for more nuanced, visual, and critical discourse analysis, with a concomitant cataloging of the discursive strategies currently embedded in textual filmic and media content in a bid to reveal *how* Hollywood in particular, and media in general, manage to privilege exonormative or native speaker models of English proficiency (Graddol, 2006; Kuo, 2006) to the detriment of endonormative or lingua franca World English models (Kirkpatrick, 2009).

Finally, to what extent will the factors of linguistic inter- and intra-intelligibility between World Englishes (Saraceni, 2009) shape linguistic renditions in the re-representation of World Englishes in the media of the future? McCrum (2010) calls for the use of a global English—Globish—which is simultaneously “neutral and intelligible” (p. 273) and devoid of local linguistic DNA. Recently, Singapore has embarked on a campaign of “clear, clean English,” a brand of English devoid of the “vagaries of Singlish” (McCrum, 2010, pp. 272–3). Not all researchers view the choice of intelligible dialects of World English for global communication to be an objective decision, and instead view intelligibility as a means to justify the persistence of “a specific, Anglophone sociocultural milieu” (Block & Cameron, 2005, p. 9). Critics question whether the issue of intelligibility in the era of globalization is a ploy to privilege inner circle varieties of English in current media which, because of market interests (Miller et al., 2005), have increasingly to adopt more global linguistic and cultural content (McDonald & Wasko, 2008).

What does all this indicate for the future representation of World Englishes in other media arenas? The publishing industry presents some trends. McCrum (2010) views global World English inclusion as a top-down effort sustained via a worldwide award culture such as the Man Booker Prize (similar to the Academy Awards in film—another globally inclusive event). Others provide a bottom-up approach in which multinational publishing houses in pursuit of increased sales engage in the commercially lucrative strategies (Gray, 2002) of inclusivity and appropriateness—glocalization strategies—in which content aims to be both inclusive and culturally appropriate. The result, reports Gray (2002, p. 159), is the “sanitization of content” accomplished via a purging of culturally inappropriate or offensive content from books in a bid to increase sales. This marketing strategy, he argues, emerges alongside a “pernicious exclusivity” (p. 163)—a scenario in which the complexity of linguistic diversity in texts is often erased. Why should we care? Currently, “The world’s English is intrinsic to the growth of contemporary India, which is now the world’s third largest English-language book market after the UK and the United States” (McCrum, 2010, p. 261). How such linguistic erasure impacts the future of World Englishes is a concern to some. Not everyone views the glocalization of media as a neutral rendering of local linguistic varieties. While those who celebrate glocalization (McCrum, 2010) see the relationship between the local and the global in such media conflation attempts as complementary and emblematic of a utopian “flat world” (Friedman, 2005)—a marketplace of information flow and egalitarian exchange buttressing “a synergetic relationship between the global and the local” (Block & Cameron, 2002, p. 3)—skeptics see glocalization as essentially asymmetrical: a dominance of the global over the local with an eager use of media to exploit local linguistic heterogeneity in a bid to sell global linguistic homogeneity (Miller et al., 2005).

The implications of the nexus between media and World Englishes are thus many. Current media can choose to include, exclude, homogenize, diminish, or erase the diversity of World Englishes—choices that will be dictated by different market pressures and economic outcomes. Additionally, it remains to be seen if future media renditions will flatten or increase center–periphery asymmetries, and whether the monopoly of media will indeed shift to outer or expanding circle domains—an orientation made more urgent with the current technological revolution which permits media bombardment in digitized formats, offering free, faster, easier access to media content than ever before.

World Englishes: Overview

BRAJ B. KACHRU

Introduction

The global diffusion of the English language represents two dimensions of the language: one of *multicanonicity* and the other of *multiculturalism*. These two constructs of what is called a global language have yet to be seriously recognized by the English-language teaching (ELT) profession. The reasons for this attitude are essentially ideological, economic and, of course, attitudinal. This ominous indifference is sustained and encouraged within what Susan Butler has characterized as “the ESL Empire” (Butler, 1997).

The ELT Empire is concerned with political power, economic interest, and, above all, cultural domination. The mantra that is repeatedly emphasized is: “Britain’s real black gold is not North Sea oil, but the English language.” The empire is “selling English by the pound” (*The Times*, October 24, 1989, p. 14). The United States of America and Australia are not far behind in this commercialism.

The dichotomy between what is termed *native* and *non-native* speakers of the language is functionally unsightful. And linguistically, it raises multiple questions, particularly in multilingual contexts. The terminological triad of English as a native language (ENL), English as a second language (ESL), and English as a foreign language (EFL) is rightly questionable; they are neither valid nor meaningful.

The above terms indicate the barriers that have been constructed to mark *us* and *other*. These concerns have been articulated by visionary specialists of the English language in all the English-using countries in the world. One might ask: have they succeeded? The answer is “yes” and “no.” What was the epicenter of the English language has, over the years, branched into a repertoire of language pluralism.

The constructs of the new identities of the language are now evident at every linguistic level. It is rightly claimed that the language has acquired multiple functional conventions. It has acquired new meanings by its functions in diverse traditions in Asia, in Africa, and in other parts of the world (see e.g., McArthur, 1992; McCrum, Cran, & MacNeil, 1993; Crystal, 1995).

When we characterize the English language as *global*, *international*, or *universal*, we are focusing on what may be called a repository of diversity. It is in this sense that the term “Englishes” is used (see also McArthur, 1993). The term *international* refers to the medium that is shared as a code of communication. The medium crosses national borders for understanding other cultures: their ideologies, their mythologies, and their ways of life and living. In 1963, Gabriel Okara insightfully titled an article “African Speech . . . English Words.” In his view, the English language is used “to express our own ideas, thinking and philosophy in our own way” (Okara, 1963, pp. 15–16). That is pragmatic reality.

What Okara characterized as his “own way” of using English has a long history among the users of World Englishes (WE). The same vision is articulated, for example, by Africa’s Chinua Achebe, Buchi Emecheta, Nuruddin Farah, Wole Soyinka, and Ngugi wa Thiong’o; by the Caribbean’s Roy Heath and Sam Salvon; by South Asia’s Anita Desai, Robin Mistry, Mulk Raj Anand, Raja Rao, and Bapsi Sidhwa by East Asia’s Shirley Lim and Edwin Thumboo; by New Zealand’s Witi Ihimaera; by North America’s Sandra Cisneros and

Rolando Hinojosa; and by Scotland's James Kelman. The creativity of these writers provides an unparalleled worldview of the language. It constructs the dynamics of cross-cultural and localized creativity in World Englishes.

What WE represent is intercultural interlocutors with one shared language and one shared medium. One might ask: what is global about it? The answer is that WE have multiple localized voices. These voices articulate their own histories. They represent their own identities. They design their own constructs of creativity. As the late C. D. Narasimhaiah elegantly writes: "English has been an effective aid to thinking globally while choosing to live locally" (Narasimhaiah, 1991, p. viii).

In the global context, one might rightly claim that English is an *international* language. However, in form, such a claim is a misnomer. There is no international variety of English. Yet educators have made attempts to construct simplified varieties of English. They did not succeed. One thinks of, for example, Basic English, Nuclear English, and Utilitarian English.

The English language has an unparalleled global profile. That profile continues to increase as time passes. The following are indicative of the diffusion of the language: first, the number of what are termed the "non-native" speakers is substantially higher than the number of "native speakers"; second, in the outer circle, India is the largest English-using country with a long history; third, in the expanding circle, China has over 200 million people with varying competences in interacting in English; fourth, every major city in Anglophone Asia and Africa has at least one newspaper in English; fifth, in major cities of the world, there is transmission of news in English by radio and by television; sixth, in major English-using countries there are users of standard (educated) varieties (*acrolects*) as well as other varieties (*mesolects*) and mixed varieties (*basilects*) such as Nigerian Pidgin, Singlish, Tex-Mex, Babu (Baboo) English, Bazaar English, and so forth.

Pluralism and Creativity

The intercultural identities of WE manifest themselves at various linguistic levels. These levels include phonetics/phonology, grammar, lexis, discourse, and pragmatics. However, each variety of WE has its distinct acculturation and its own sociocultural contexts, for example, African, South Asian, East Asian.

In multilingual contexts, these identities are transcreated from one language to another and from one canon of creativity to another. This transcreation is evident in, for example, Raja Rao's *The Serpent and the Rope* (1960), in which Rao re-creates the metaphysical tradition of Sanskrit. Nigeria's Chinua Achebe is yet another example of a creative writer who crossed the traditional contextual borders of the English language. The credos for their creativity were constructed by Rao and Achebe on their own terms: Rao for *Indianization* of English and Achebe for its *Africanization*.

The pandits of the English language have defined such creativity—that of Rao and Achebe—as *translation*, *transfer*, *transcreation*, *relexification*, and *hybridization*. Whatever term is used, the result is that the English language goes through a creative process such as *Africanization*, *Indianization*, or *Singaporeanization*.

The visionary Nobel laureate (1986) of Nigeria, Wole Soyinka (1993, p. 88), refers to the "unaccustomed roles" of English in Africa. What Soyinka suggests is a "reincarnation" of the English language. In Soyinka's view, and rightly so, the English language has turned into "a new medium of communication." The *context of situation* in Africa, as the late British linguist John Rupert Firth (1890–1960) would say, has altered the functions of English. The result of such constructs is, Soyinka explains, "A new organic series of mores, social goals, relationships, universal awareness—all of which go into the creation of a new culture" (1993, p. 88).

Achebe explains his often-quoted pragmatic construct for African writers in these words: "Most African writers write out of an African experience and of commitment to an African destiny. For them that destiny does not include a future European identity for which the present is but an apprenticeship" (Achebe, 1992, p. 34).

Soyinka's explanation for linguistic creativity and resulting Africanization is somewhat different. The imagery is violent: "[b]lack people twisted the linguistic blade in the hands of the traditional cultural castrator and carved new concepts into the flesh of white supremacy." The result, Soyinka says, is "the conversion of the enslaving medium into an insurgent weapon" (1993, p. 88). Whichever view of indigenization of the language in the outer circle one prefers, it has resulted in legitimization of bilinguals' creativity and the underlying cultural contexts of the "loose canons" of World Englishes (Gates, 1992).

Identity Construction Without Mythology

Identity construction in the English language, in what is characterized as the third world, is not always accepted with open arms. This is evident in constructs of pedagogical resources such as curriculum content.

There is an articulate group who, as mentioned earlier, agonize over the recognition of multiculturalism and multiple identities of the language. Their concern is that the language is drifting from its exclusive Eurocentric, Judeo-Christian, and Western identity. Henry Louis Gates, Jr. is warning us about such people when he says that cultural pluralism "is not, of course, everyone's cup of tea" (Gates, 1992, p. xvi).

The mythology manifests itself in the *acquisition* of English, and in its *varieties* in distinct cultural contexts in the *Outer* and *Expanding* circles. The following myths about the English language are illustrative:

The interlocutor myth (see B. Kachru, 2005, pp. 1–20): The English language is primarily learned in order to communicate with what are termed the "native" speakers of the language (e.g., American, British, and Australian). However, the reality is that most interactions take place among those who use English as an *additional* language. In the world context, the possible interlocutors could be Indians with Nigerians, Germans with Chinese, Koreans with Singaporeans, or Pakistanis with Sri Lankans.

The monocultural myth: To study English is to imbibe the cultures of the English-speaking Westerners (e.g., Americans, British, Canadians, Australians). The reality is that the English language is used to cross language borders to communicate across states, as in India.

The model dependency myth: The learners of English across the world are educated in what is believed to be the *exocentric* model of the language. That entails imposing the American or British variety of the language. In reality it is the *endocentric* (local) model that the students learn, and that the teachers are familiar with.

The Cassandra myth: Variation at any linguistic level (e.g., phonetic, grammatical, lexical, discursal) in a variety of English (e.g., African, Indian, Singaporean) is an indication of failure in language teaching, learning, or both.

World Englishes and Canonicity

The interculturalism of World Englishes is constructed with a restricted vision by the pedagogical pandits. The creativity in World Englishes (e.g., in Africa and Asia) is characterized as balkanization of the "Western Canon." The distinct identities in the creativity of Asian and African Englishes are represented as planned, managed, promulgated by

4 WORLD ENGLISHES: OVERVIEW

those who support a new tongue for new times (Bailey, 1990, p. 86). What Bailey says is almost identical to what defenders of the “Western Canon” have characterized as “liberation linguistics.” This is a loaded term.

There is no paucity of constructs separating the “untouchables” of World Englishes. These include the varieties named as: *terra anglia*, *third world literatures*, *colonial literature*, *postcolonial literature*, and *Commonwealth literature*. These terms are like loaded weapons. These characterizations marginalize those who are not part of the inner circle.

A touching example is what an officer of the British Council told to a distinguished, internationally celebrated writer, Salman Rushdie: “[a]s a Commonwealth writer . . . you probably find, don’t you, that there’s a kind of liberty, certain advantages, in occupying, as you do, a position on the *periphery*” (Rushdie, 1991, p. 61; emphasis added). It was over ten years earlier that the “periphery” holder, Rushdie, had said:

[The English] language needs to be decolonized to be made in other images, if those of us who use it from positions outside Anglo-Saxon cultures are to be more than artistic “Uncle Toms.” And it is this endeavour that gives the new literatures of Africa, the Caribbean, and India much of their present vitality and excitement. (1982, p. 7)

Conclusion

A creative writer and critic, Wimal Dissanayake, characterizes the decolonization of World Englishes in these terms:

There is a dialectical interplay between language and consciousness, and we do not have to be phenomenologists to subscribe to this view. What writers like [G. V.] Desani, [Raja] Rao, and [Salman] Rushdie are trying to do is to decolonize the English language . . . in the longer run, this decolonization of English will prove to be the language’s greatest boon, emerging as it surely will, as a vehicle of communication expressing the deepest thoughts and feelings and imaginings not only of the Anglo-Saxon world, but also of the non-Anglo-Saxon world.

The optimistic Dissanayake emphasizes: “When that happens, English as a truly universal medium of creative expression will have arrived” (1985, p. 241).

In the construct of the creative writers the language was to be redeemed from its exhaustion: It had to be revived with fresh stylistic and contextual innovations to assure African, Asian, and Caribbean challenges. The linguistic “weapon” had to be redefined. In Bhabha’s view (1994, p. 166):

Salman Rushdie’s *The Satanic Verses* attempts to redefine the boundaries of the Western nation, so that the “foreignness” of the language become the inescapable cultural condition for the enunciation of the mother tongue. In the “Rosa Diamond” section of *The Satanic Verses* Rushdie seems to suggest that it is only through the process of dissemination—of meaning, time, peoples, cultural boundaries and historical traditions—that the radical alterity of the national culture will create new forms of living and writing.

In the new century it is evident that the contexts and constructs of World Englishes are changing. It seems that what was the *periphery* is now almost the center. The traditional sacred pedagogical and attitudinal cows of English studies are rightly being challenged.

Writing and Content Area Learning

AGNIESZKA MAZUR AND SARAH WARSHAUER FREEDMAN

Introduction

Writing commonly helps students achieve disparate goals connected to school learning not just in English class but in all the disciplines. Writing functions to help us remember, imagine something new, communicate, and display what we have learned or what we think. Griffin and Cole (1984) point out that from the inception of literacy in the form of tokens in the Middle East, “writing and reading were embedded in activities which had a complex higher level goal” (p. 70). And so it is that writing is a tool that can help students achieve complex, higher-level goals in school settings too. School-related writing can take the form of notes on class discussions, copying of homework assignments, student journals for reflecting on reading, e-mail to friends and other social networking related to academic issues, marginal notes commenting on a piece of reading, laboratory notes, examinations, formal course papers, and so on. And each type of writing, in some way, has the potential to contribute to the most central goal of schooling: a student’s learning. As Shanahan (2004) explains in his review of research on writing to learn, “there have been so many studies showing that writing improves learning that it appears to be a closed question” (p. 61).

Traditionally, writing has been framed as a general set of language skills that language arts teachers and English instructors have had the responsibility of teaching. However, both writing and thinking seem to be shaped by discipline-specific discourse conventions and discipline-specific constructs of what counts as knowledge (Bazerman, 1984, 1988). Thus, instead of defining writing as a generic set of transferable skills, writing appears to be a particularly useful tool for learning in kindergarten to 12th grade (K-12) and postsecondary settings when used across subject areas.

In K-12 settings writing-to-learn approaches, such as informal journal writing, have been shown to help students learn concepts, delve deeply into subject matter, and reflect on their learning (Langer & Applebee, 1987; Johnson, Jones, Thornton, Langrall, & Rouse, 1998; Prain & Hand, 1999; Freedman, Delp, & Crawford, 2005). However, more research is needed on the difficulties and possibilities of understanding how English learners (ELs) in K-12 settings use writing-to-learn as they grow as writers and thinkers.

In postsecondary settings, however, the focus of research shifts to what is involved in mastering disciplinary genres, to learning-to-write in the disciplines. Studies include how students learn to construct and display knowledge, use specific discourse structures, and respond to audience expectations for particular types of writing. For instance, a central concern of research on disciplinary writing in university settings is how students learn the favored conventions and modes of expressions of disciplinary discourse communities (Herrington, 1985; Swales, 1990; Beaufort, 2007). There is robust postsecondary research on ELs that highlights what is involved in learning these skills. After examining what we know about both writing-to-learn, with its K-12 focus, and learning-to-write, with its postsecondary focus, we conclude by discussing concerns about and recommendations for improving the quality and effectiveness of content area writing.

Writing and Content Area Learning in K-12 Settings: A Focus on Writing-to-Learn

Native English Speakers

At the primary level, research shows that even native English speaker (NES) first graders increase agility with both scientific concepts and the conventions of science writing through family message journals. When first graders wrote daily to their families about what they learned during classroom science lessons and activities, they demonstrated growth over time in their ability to think and to express themselves in ways favored in science (Wollman-Bonilla, 1998). Similarly, when fifth graders used journal writing to describe their thinking and reasoning before completing probability problems, they showed increased ability to solve problems correctly and greater facility in describing the process they used in solving these problems (Johnson et al., 1998).

At the secondary level, any sort of writing activity, including note taking and short-answer questions as well as extended writing, has been found to lead to more learning than reading and studying alone. In a study of 18 science and social studies classrooms, “different kinds of writing activities led students to focus on different kinds of information, to think about that information in different ways, and in turn to take quantitatively and qualitatively different kinds of knowledge away from their writing experiences” (Langer & Applebee, 1987, p. 135). Extended analytical writing led students to focus a few ideas in complex ways, which allowed them to remember the topics they explored for a longer period of time than if they completed short-answer study questions. Conversely, short-answer study questions allowed them to recall more information, but only for the short term. In another study, writing in a biology classroom led to a variety of different learning and thinking functions depending on the occasion and on the ways that individual students employed writing (Prain & Hand, 1999).

High school students demonstrated greater understanding of biological concepts when they translated these concepts into simple language. When they wrote about these concepts to third-/fourth-grade students, they learned more than when they wrote to their teacher, parents, or peers (Gunel, Hand, & McDermott, 2009). The act of translating complex concepts into everyday, simple language seemed to push students toward this deeper understanding of subject matter.

In an eighth-grade English literature classroom, culturally and linguistically diverse students deepened their understanding of subject matter by incorporating each other’s voices and ideas during classroom writing practices (Freedman et al., 2005). By reading and responding to each other’s log writing about the ideas they encountered in their reading and discussion, students were able to incorporate the ideas of their peers in ways that transformed their own ideas and thereby deepened and expanded their understanding of the texts they studied. Students also gathered ideas from each other by writing down contributions made during whole-class discussion. This writing was structured so that students could organize their notes as ideas developed over the course of a literature unit. Similarly, in a comparative study of three social science classrooms, high school students engaged with history content particularly when discussion and writing were interrelated and when students were taught to incorporate each other’s voices in their writing (Dysthe, 1996).

As is the focus of most research at the postsecondary level, a study of more advanced writing classes in high school—advanced placement history classes, equivalent to university-level classes—turned to examine learning-to-write in ways that helped students develop disciplinary discourse knowledge; the students were writing-to-learn by learning-to-write

(Young & Leinhardt, 1998). When students wrote from primary sources, they grew in their content knowledge through understanding history from multiple perspectives rather than seeing it as a series of unquestionable “facts.” Concurrently, students developed greater ability to make arguments and include interpretations in their writing about the past instead of simply summarizing what they read.

English Learners

In US public school settings, understanding the connection between writing and content area learning for EL-designated students is complicated by the tendency, especially at the secondary level, for schools to isolate multilingual students in EL tracks where they are exposed to little writing or learning of any sort (Valdés, 2001; Callahan, 2005). While psycholinguistic research suggests that multilingual students may have greater cognitive and linguistic flexibility than students who know only one language (Romaine, 1989; Bialystok, 2001), multilingualism generally has been treated as a deficit to be overcome in public schools.

However, studies of ELs in elementary school classrooms designed to facilitate bilingual Spanish–English students’ learning and literacy development provide a model of an environment where “children learned to use their bilingualism deliberately, consciously, to access and manipulate resources for intellectual and academic purposes” (Moll, Saez, & Dworin, 2001, p. 444). For example, one child read English texts on which she took notes in Spanish and then wrote a report on Sioux Native Americans in Spanish from these notes. She was thus able to use the many tools in her linguistic and cultural toolkit to engage in writing and learning activities. Additional studies are needed to help us better understand how ELs learn to write across the disciplines as well as how writing in their multiple languages might function to help them acquire disciplinary knowledge.

Writing and Content Area Learning in Postsecondary Settings: A Focus on Learning-to-Write

Native English Speakers

Much like their counterparts at the secondary level who focus on the transition to university for advanced placement students, most postsecondary research with NES populations focuses primarily on how students learn to write in the disciplines. Researchers are interested, however, in the relationship between acquiring the disciplinary writing conventions and learning the material of the discipline itself. In the end, the main focus at the postsecondary level, on learning-to-write, is centrally concerned with how learning-to-write in disciplinary courses teaches students ways of thinking and doing in those disciplines.

Charles Bazerman’s (1984, 1988) rhetorical analyses across the disciplines have been particularly influential in providing a foundation for studying learning to write in the disciplines. Bazerman has examined the character and role of prominent articles in various disciplines, including biochemistry, sociology, and literary studies. He found that each discipline constructs its own specific understanding of audience, of authorial role, and of what counts as knowledge. Reflecting this emphasis on the specialized discourses of disciplines and professions is the name “writing in disciplines” (WID), which is widely applied to pedagogical approaches that focus on the unique language conventions, format, and structure for writing in particular disciplines. Indeed, “WID believes that to participate successfully in the academic discourse of their community, students must be taught discipline-specific conventions and should practice using these conventions” (Wells, 2010).

Learning the conventions for writing in a discipline does appear to help students participate in academic discourse communities (Herrington, 1985; Beaufort, 2007; Carter, Ferzli, & Wiebe, 2007). For instance, 10 undergraduate biology students were “apprenticed” into science writing and thinking through writing lab reports. These reports helped students make connections between lecture material and the experiments they performed in the lab and to communicate those connections in ways valued in the biological sciences (Carter et al., 2007).

However, because discourse communities are not explicitly discussed in college courses, students may have difficulty in understanding how and why ways of thinking and writing vary so much between disciplines and to a lesser degree between different courses in the same discipline. For instance, an undergraduate student struggled to write and think according to the requirements of two different discourse communities: history and engineering. Only after graduating and working as an engineer was he able to understand fully the functions of writing engineering reports and to master the genre for his purposes (Beaufort, 2007). Moreover, two college chemical engineering classes represented distinct communities where different issues were addressed, different lines of reasoning used, different writer and audience roles assumed, and different social purposes served by writing (Herrington, 1985). In college settings, the discourse community of the classroom may be removed from the professional discourse community, or even from that of other courses in the same discipline, making it difficult for students to understand the demands of the discipline.

A few postsecondary researchers have attended primarily to writing-to-learn. They have found that writing-to-learn through journaling and informal writing helps students find meaning in and personal connections to the material they encounter in their coursework, and also helps them work through ideas and professional identities (Geisler, 1994; Herrington & Curtis, 2000; Medway, 2002). The personal connections motivated students to pursue areas of study in ways that led to a greater understanding of themselves as thinkers and actors within a particular discipline or future profession. For instance, architecture students used writing to elaborate drawings in their sketchbooks; they used this informal and expressive writing to help them explore how to look at the world as an architect and to rehearse “both content and the rhetoric” of the discipline (Medway, 2002, p. 111).

However, some have questioned the effectiveness of some types of writing-to-learn pedagogical approaches. For instance, on the final exam in an undergraduate Chinese literature course, students who kept academic journals, as well as those who did not keep journals at all, outperformed students who kept personal response journals. The students using personal response journals seemed unable to perceive the issues that were pertinent to their professor and thus did not focus on what would have prepared them for the essay exam. Instead, they followed lines of inquiry that did not match the demands of the test (MacDonald & Cooper, 1992). Journaling in postsecondary settings has been found to be most effective when students and instructors shared an understanding of the specific purpose that the assigned writing served and when assessments aligned with the types of writing that students used throughout the course (Cannon, 1989; Hartman, 1989; Cowles, Strickland, & Rogers, 2001). In vocational courses in 10 colleges across the United Kingdom, students struggled to understand the meaning and purpose of reflective writing in which they were to report and reflect on what they were learning in workplace or practical training settings (Ivanic et al., 2009). According to the researchers, “‘Learning logs’ of various sorts have . . . become popular under the auspices of student-centered learning, but the genre of reflective writing for this purpose is not taught, and indeed seems to be thought of as a ‘natural’ form of self-expression. This is something students struggled with” (p. 184).

Adding English Learners to the Mix

Research and pedagogy in postsecondary, second language (L2) writing generally shares the writing-to-learn perspective. For instance, English for specific purposes (ESP) researchers have been especially interested in examining the linguistic and rhetorical purposes and audiences in fields such as business, engineering, and science in order to facilitate learning in these areas (Swales, 1990; Bhatia, 1993). Research on both first language (L1) and L2 writing has also focused on the concept of discourse communities, which L2 researcher John Swales (1990) defines as learning to be a member in a community of writers who write in specific ways for specific purposes. As Swales puts it, "Discourse communities are sociorhetorical networks that form in order to work towards sets of common goals. One of the characteristics that established members of these discourse communities possess is familiarity with the particular genres that are used in the communicative furtherance of these goals" (p. 9). Therefore, through learning how to use and manipulate disciplinary genres, students learn to act according to shared goals and understandings within a disciplinary discourse community. In studies of L2 writing, researchers have closely examined linguistic moves that students need to be able to use in their writing in order to participate effectively in the disciplinary discourse communities (Flowerdew, 1993).

Thus, writing socializes both L1 and L2 students into discipline-specific discourse communities, which have preferred ways of acting rhetorically, including using linguistic conventions to achieve specific goals. For example, L1 and L2 second-year graduate students in the biological sciences were apprenticed to the discourse community of National Institutes of Health grant writing. In their grant writing seminar, students were taught how to write stylistically and rhetorically effective grants and were made familiar with the process by which grants are evaluated (Ding, 2008). Moreover, through writing lab notes in informal settings, such as in laboratories and through writing in collaboration with experts and colleagues, students acquired disciplinary knowledge and expertise. Those who wrote the most sophisticated grants integrated both stylistic and disciplinary knowledge. Thus, "the usual separation between the rhetorical and stylistic aspect of writing and the scientific merit of the actual written product is artificial, unproductive, and counterintuitive to students" (Ding, 2008, p. 47).

National Concerns About Writing in US Schools

In recent years, there has been growing concern that writing in K-12 classrooms has become an ever-lower priority. This concern is especially acute for public schools that serve economically and linguistically nondominant students, including EL-designated students and those who speak African American Vernacular English (AAVE), since students in such schools have tended to perform poorly on standardized assessments. Faced with impending sanctions, the schools have been pressuring teachers to "teach to the test." Because writing generally is not featured in high-stakes assessments, it has not been a central concern.

According to the report of the National Commission on Writing for America's Families, Schools, and Colleges (2003), "the valuable tool of writing must be put back in the hands of schoolteachers . . . because writing (and all the conceptual skills it reflects and develops) opens up new and powerful means of learning for all students" (p. 16). The Commission argues that the need for reform is critical since many students are rarely writing-to-learn or learning-to-write. Moreover, the Commission stresses that the needs of students identified as EL must be a central concern of writing reform efforts since EL students are one of the fastest growing populations in US schools.

When students do write, they tend to perform at a basic level, which “demonstrates only a limited grasp of the importance of extended or complex thought” (National Commission on Writing, 2003, p. 55). For instance, the non-high-stakes National Assessment of Educational Progress, which does include a writing assessment, revealed that students today have a “basic” grasp of writing, but what they are producing is “relatively immature and unsophisticated” (p. 55). Even though the writing assessment does not test how students use writing as a tool either for learning or for participating in disciplinary discourse communities, it does show that students are struggling with clearly expressing complex ideas and arguments. The Commission concludes that students’ performance falls far short of what they will need to succeed in our complex social and economic environment, in which the “demands for clear written communication are apparent in many arenas . . . including in technical fields of work such as engineering, which increasingly emphasize written materials such as proposals and interim and final reports” (National Commission on Writing, 2003, p. 49). In response to this problem, a central recommendation is to increase writing across the curriculum (WAC) pedagogy for all students. This instructional approach emphasizes the widespread use of writing as a tool for learning in K-12 and postsecondary settings across subject areas, from the humanities to mathematics and science.

Conclusion

Students use writing to achieve learning goals in various ways, depending on the learning context and activity in which they participate as they write. Research on writing and content area learning in K-12 settings focuses mostly on writing-to-learn pedagogical approaches for NESs. Findings show that there are many ways in which writing can lead to learning, from supporting students in understanding content material, to helping them explore and create ideas and identities. Different types of writing promote different types of learning. In K-12 settings most research focuses on NESs; more research is needed about ELs and how they might best use their multiple language resources in the service of their learning.

In postsecondary settings the research and perhaps even the pedagogic focus shift to learning-to-write for both NES and EL students. Findings show that writing is not a neutral tool, and that acquiring disciplinary writing conventions is interrelated with learning the material of the discipline itself. For instance, different types of writing differently construct what counts as knowledge, require specific discourse conventions, and carry particular audience expectations. This understanding is reflected in research in postsecondary settings to a greater degree than in K-12 studies, perhaps mirroring the increased demands on postsecondary students to become apprenticed in disciplinary discourse communities.

In practice and conceptually, a great deal of overlap exists between writing-to-learn and learning-to-write. A thoughtful integration of writing-to-learn and learning-to-write for all ages seems to hold promise for improving the teaching and learning of writing across content areas and grade levels, with attention to how different types of writing lead to different types of learning. We need to understand more about the complex relationships between writing-to-learn and learning-to-write and the processes that overlap and diverge for NES and EL students.

Writing and Genre Studies

JAMES R. MARTIN

Genre in Three Traditions

The term “genre” is used in so many different ways in applied linguistics in relation to writing that it has become customary to map out the field in relation to three traditions, introduced by Hyon (1996). These comprise the English for specific purposes tradition (ESP) (Swales, 1990), New Rhetoric (Miller, 1984), and the Sydney School (Cope & Kalantzis, 1993). As a useful reading path into this cartography, alongside Hyon, Christie (2008) or the introduction to Johns (2002) are recommended; next Hyland (2007), and then Yunick (1997); Grabe and Kaplan (1996) further contextualize this work. The ESP tradition has a strong focus on tertiary genres, especially in relation to the needs of non-native speakers of English learning academic discourse. It emphasizes the communicative purpose of genres for the people who use them, and correlates this with selected linguistic features. The New Rhetoric tradition grows out of a concern with how people use genres in achieving particular purposes in particular contexts. It emphasizes the social action people perform through genres, as well as the intersubjectivity of users, drawing on traditional and contemporary rhetoric, Bakhtin, and contemporary critical theory. The Sydney School begins with primary, later secondary, and then tertiary writing, focusing in particular on the needs of migrant, indigenous, and working-class students. It emphasizes the linguistic and semiotic structure of genres, as part of the model of language and social context developing as systemic functional linguistics (hereafter SFL). For a useful historical overview of the emergence of these genre studies out of earlier work on register and composition see Benesch (2001).

Key readings in the ESP tradition include Swales (1990) and Bhatia (1993); for New Rhetoric see Miller (1984), Bazerman (1988), Freedman and Medway (1994), Berkenkotter and Huckin (1995), Coe, Lingard, and Teslenko (2002); for the Sydney School see Cope and Kalantzis (1993), Christie and Martin (1997), Feez (1998), Martin (2000), Unsworth (2000), Martin and Rose (2008), Hood (2010). The best survey of the pedagogical implications of the three traditions is Johns (2002); Hyland (2004) is an accessible practical introduction focusing on second language writing.

Knowledge Structure

As cross-references reveal, over time there has been a fair amount of dialogue among these three traditions; and for many scholars the boundaries have arguably become blurred (e.g., Artemeva & Freedman, 2006). Accordingly what is developed here is an alternative perspective, drawing on Basil Bernstein’s late work on knowledge structure. This should allow consumers to distinguish more clearly among different trajectories of research and practice in relation to their own disciplinary backgrounds and pedagogic needs.

Developing his earlier concern with common and uncommon sense discourse, Bernstein (2000) distinguishes between horizontal and vertical discourse, and within vertical discourse between hierarchical and horizontal knowledge structures (outlined in Figure 1). His characterizations of these discourses are as follows:

2 WRITING AND GENRE STUDIES

A *Horizontal discourse* entails a set of strategies which are local, segmentally organised, context specific and dependent, for maximising encounters with persons and habitats. . . . This form has a group of well-known features: it is likely to be oral, local, context dependent and specific, tacit, multi-layered and contradictory across but not within contexts. . . . a *Vertical discourse* takes the form of a coherent, explicit and systematically principled structure, hierarchically organised as in the sciences, or it takes the form of a series of specialised languages with specialised modes of interrogation and specialised criteria for the production and circulation of texts as in the social sciences and humanities. (Bernstein, 2000, p. 157)

A hierarchical knowledge structure is “a coherent, explicit and systematically principled structure, hierarchically organised,” which “attempts to create very general propositions and theories, which integrate knowledge at lower levels, and in this way shows underlying uniformities across an expanding range of apparently different phenomena” (Bernstein, 1999, pp. 161–2). A horizontal knowledge structure is defined as “a series of specialised languages with specialised modes of interrogation and criteria for the construction and circulation of texts” (Bernstein, 1999, p. 162).

As we can see, Bernstein is making a distinction here between the everyday practical discourse that students bring to school and the academic discourse schools have evolved to teach. And within academic discourse he is distinguishing the kind of technically integrated knowledge constructed in science from the less technical, more segmental understandings built up in the social sciences and humanities.

Muller (2007) elaborates these ideas, proposing the term “verticality” to describe how theories progress, via ever more integrative or general propositions or via the introduction of a new language which constructs a “fresh perspective, a new set of questions, a new set of connections, and an apparently new problematic, and most importantly a new set of speakers” (Bernstein, 2000, p. 162). Borrowing Bernstein’s image of the triangle for hierarchical knowledge structures and iterating languages for horizontal ones, Muller’s conception of verticality is schematized in Figure 2.

In addition Muller proposes the term “grammaticality” to describe how theoretical statements deal with the phenomena they are modeling. The stronger the grammaticality of a language, the more stably it is able to generate empirical correlates and the more unambiguous it is because the field of referents is more restricted. Hierarchical knowledge

Figure 1 Bernstein’s reformulation of common and uncommon sense

Figure 2 Verticality in relation to progress for hierarchical versus horizontal knowledge structures

Figure 3 Grammaticality in relation to empirical correlates for hierarchical versus horizontal knowledge structures (testing vs. interpreting)

structures in other words *test* theories against data; horizontal knowledge structures use theory to *interpret* texts (see Figure 3).

Wignell, in a 2004 presentation later published in Christie and Martin (2007, pp. 184–204), has suggested that the social sciences might best be conceived as warring triangles since they tend to model themselves on science rather than humanities (where the drive to integration via ever more general models and propositions is much less strong). Although the warring triangles battle institutionally and epistemologically for hegemony, and often single theories become dominant, successfully marginalizing rivals, no one theory ever manages to take over the whole discipline and reigning theories come and go. It appears that in social science verticality and grammaticality is simply not strong enough to enable theoretical integration in relation to the complex social phenomena being described. Rather the social sciences “progress” like the horizontal knowledge structures they are, by adding new triangles with new sets of speakers (e.g., various functional theories such as SFL, role and reference grammar, lexical functional grammar, functional grammar or functional discourse grammar in linguistics, or various gazes on the past we might denominate as traditional, Marxist, feminist, queer, or postcolonial in history). Wignell’s construal of vertical discourse as more of a cline than an opposition or complementarity is outlined in Figure 4, filling in some exemplary singulars ranged along the scale.

We are now in a position to ask about different theories of genre in relation to the kind of knowledge involved: Which discipline or disciplines are involved, and how does this

Figure 4 Vertical discourse as complementarities along a cline

affect verticality and grammaticality? How might we now position the ESP, New Rhetoric, and Sydney School traditions?

Starting from the left of the hierarchical–horizontal knowledge structure axis, we can place the Sydney School to the left of the social science region of the spectrum since it is informed by SFL and conceives of genre as part of this social semiotic model of language and social context. It thus has relatively strong verticality, striving to integrate propositions responsible for an ever-increasing set of multimodal data. And it has relatively strong grammaticality in a qualitative sense, since it is able to produce rich multidimensional readings of actual texts; because, however, these readings for the most part depend on time-consuming manual analysis, the Sydney School is still seriously compromised as far as quantitative testing of hypotheses is concerned.

ESP is next in line, in part because it is multidisciplinary and in part because of its linguistic focus on form (instead of meaning). Its multidisciplinary weakens verticality, because carefully selected and recontextualized discourse from various knowledge structures is hard to assemble into an integrated whole. The tendency is thus for ESP to become more multidisciplinary over time; as new segments of knowledge are needed they are added on. ESP's focus on linguistic form (instead of meaning) weakens grammaticality, since formal analysis of texts, however quantitative (e.g., Hyland, 2000), is not rich enough to put its ideas about genre at risk. Genres are thus mainly described in relation to intuitions about speakers' intentions and "ethnographic" studies of the social function of texts in discourse communities, something which makes ESP more like New Rhetoric as far as definitions of genre are concerned. It is interesting in this regard at conferences, or in canonical papers and monographs, to see how very few examples of genres actually appear, and where they do appear how little linguistic analysis, if any, is offered—usually not much beyond a rough characterization of the main stages of the exemplar and their names, with terms for genres and their moves more often than not taken directly from the names used by practitioners in one or another field (their professional rhetoric in order words). The absence of analyzed exemplars compromises dialogue with traditions such as the Sydney School, where detailed text analysis and specialized linguistic labeling is paramount.

With New Rhetoric, we move from the social sciences to humanities, not surprisingly given its genesis in rhetoric and English studies. Verticality is very much weaker, with far fewer technical terms deployed, and where they are used with far fewer formally structured interconnections among them. Who you read becomes in a sense more important than what you know. Grammaticality involves the interpretation of texts, which are almost always absent (as in literary studies where the poem, short story, or novel under consideration is taken as given, and is in any case too long to reproduce). Weak grammaticality has the advantage of allowing New Rhetoricians to theorize about a large set of relatively long relevant texts, as in Bazerman's (1988) classic study of the genesis of Newton's discourse. As far as the interpretation of texts goes, the gaze is likely to be more critical, with reference to French masters, than in ESP.

At this point we should also note that horizontal discourse has a more privileged place in both ESP and New Rhetoric than for the Sydney School. As linguists, SFL genre analysts are trained not to rely on what native speakers say about their language (their folk-linguistics), but rather to look directly at the language they use and describe that. So folk theories of genre, from practitioners in any field, would be treated with suspicion (e.g., primary school teachers' notion that everything written by their students is a story). ESP on the other hand makes use of ethnography to examine the discourse communities in which genres function. Swales (1998) is the classic treatment, exemplifying as it does the use of participant observation, over many years, as canonized in anthropology by scholars such as Malinowski (see also Prior, 1999); similarly Bhatia (e.g., 1993, 2004) carefully situates genres in professional practice. New Rhetoric, given its critical stance, is arguably more

open than the Sydney School or ESP to the insertion of segments of horizontal discourse directly into its publications, and to foster such in student writing, especially where this involves stories by subjects argued to have been disempowered by vertical discourse. These two predispositions toward horizontal discourse come together in what is now referred to as autoethnography, which involves reflective personal narratives by humanities scholars studying themselves (see Nunan & Choi, 2010). The danger of using horizontal discourse uncritically to “triangulate” research is flagged by Bernstein (2000, p. 70) as the problem of “ethno-” without “-graphy,” that is, taking what practitioners report about their practice in an interview or two at face value, or celebrating the insertion of confessional narratives in academic texts as a supposed means of valuing and empowering the voice of the “other.”

Perhaps enough has been said at this point to illustrate the ways in which Bernstein’s model, and its elaboration by Muller and Maton (Christie & Martin, 2007; Christie & Maton, 2011) can be used to position genre studies in ways that complement Hyon’s three traditions. From the perspective of SFL, Berkenkotter and Huckin (1995), for example, have always sat uneasily in the New Rhetoric tradition because of the way they draw in part on linguistically informed discourse analysis. Benesch (2001) exemplifies the ESP tradition where informed by the kind of critical theory typically associated with New Rhetoric. Artemeva and Freedman (2006) combines New Rhetoric with activity theory inspired by Vygotsky and Leont’ev. And Macken-Horarik (1998) develops a critical perspective in relation to Sydney School initiatives.

What is important is not to argue where scholars fit, but rather to consider the consequences for verticality and grammaticality, and thus for positioning along the hierarchical-horizontal knowledge structure axis which a particular position affords. To put this in more mundane terms, speaking as a linguist, in taking up a position on genre you have to decide whether you want to do a linguistic analysis of texts or not, which model of language you choose to inform this analysis, how thorough you want to be, how much or how little hangs on such analysis, how many texts you want to analyze, how much analysis will be done manually and how much can be automated or semi-automated, how qualitative or quantitative you want to be, whether you will do multimodal analysis or not, what else counts as research above and beyond or instead of text analysis, whether you are going to do ethnography or not and how (e.g., through an interview or two or via long-term embedded participant observation), how intuitive you want to be about the social function of texts or the social action involved, how much history you take into account (including the personal history of writers and the cultural history of genres), how many genres you consider, how and whether you want to relate them to one another, how critical you want to be, and ultimately where you want to belong: in which journals, at which conferences, in which academic positions—which brings us to the question of pedagogy and what you are trying to do with genre analysis in the first place.

To proceed further, into practice, we need to draw on one more distinction of Bernstein’s, between singulars and regions:

A discourse as a singular is a discourse which has appropriated a space to give itself a unique name. So, for example physics, chemistry, sociology, psychology . . . these singulars produced a discourse which was about only themselves . . . had very few external references other than in terms of themselves . . . created the field of the production of knowledge . . . In the twentieth century, particularly in the last five decades . . . the very strong classification of singulars has undergone a change, and what we now have . . . is a *regionalisation of knowledge* . . . a recontextualising of singulars . . . for example, in medicine, architecture, engineering, information science . . . any regionalisation of knowledge implies a recontextualising principle: which singulars are to be selected, what knowledge within the singular is to be introduced and related? . . . Regions are the interface between the field of the production of knowledge and any field of practice . . . (Bernstein, 2000, p. 9)

Figure 5 Sydney School teaching/learning cycle (from Martin, 1998) © J. R. Martin

In these terms education is clearly a region of practice, and of Hyon's traditions, SFL is the one that has used its theory of genre not just to describe texts but also to design teaching practice. This practice has drawn heavily on SFL studies of language development (e.g., Painter 1984), Bernstein's classification and framing analysis of pedagogic discourse, and Vygotskian-inspired notions of scaffolding. One model of this evolving pedagogy is presented in Figure 5 (see Martin, 1998), and involves phases of deconstruction, joint construction, and independent construction and ongoing attention to setting genres in their social context and building up understanding of the field of each genre (its knowledge structure in other words). The basic idea is never to ask students to write on their own until you have shown them a model of what you are expecting and in addition written an exemplar together with them. All stages are informed by explicitly sharing knowledge about genres, their staging, and linguistic (and imagic) realization with students.

Pedagogy in the ESP and New Rhetoric traditions is much less developed. Implied ESP practice appears to involve a deconstruction stage where models of genres and knowledge about their move structure and realization is shared with students. Swales and Feak (2000) exemplifies this applied ESP approach. New Rhetoric scholars (e.g., several papers in Freedman & Medway, 1994) often express strong reservations about modeling (let alone joint construction) for fear of overidealization of genres and uncritical naturalization of hegemonic discourses. Some indeed (e.g., Freedman) have reservations about the possibility of teaching genres at all once they are decontextualized from genuine sites of practice into school (see Beaufort, 1999, for an illuminating study of how written genres are actually learned in the real world, and from the New Rhetoric perspective see Devitt, 2004, on situated workplace discourse and promoting genre awareness, contra Freedman, in institutionalized learning). Where teaching is countenanced, New Rhetoric would be generally disposed to an ideological deconstruction of genres as part of any program of apprenticeship.

We can thus see the influence of verticality and grammaticality on pedagogy. The less verticality, the less a theory will be interested in a cartography of genres (see Martin & Rose, 2008), the less able to map curriculum with such (see Feez, 1998), the less able to distinguish genres from genre complexes (Martin & Rose, 2008), and the less willing to

model genres as ideal types (see Christie & Martin, 1997); the less grammaticality, the less able to discuss the distinctive features of a genre and the more reluctant to establish explicit criteria for evaluation. And in general, the more one moves to the humanities end of the knowledge structure cline, the more emphasis is placed on a critical perspective and the less on giving students access to canonical genres of vertical discourse.

Envoi

As we have seen, genre theory offers something for pretty much everyone. How you access the field will depend theoretically on your own disciplinary predisposition and practically on the outcomes you envisage for your students. It is wise to guard against eclecticism, picking up bits and pieces of genre theory here and there and an array of teaching strategies that seem to work. It is more important to reason carefully about the knowledge structure you are engaging with and its repercussions for classroom practice. That way, understanding can progress and learning outcomes can improve.

I am indebted to Natasha Artemeva, Carol Berkenkotter, Sue Hood, and Ken Hyland for comments on this entry; shortcomings remain my responsibility alone.

Writing and Language for Specific Purposes

CHRISTINE M. TARDY

While writing arguably occurs in most, if not all, language for specific purposes (LSP) settings, it is most prominent in business, academic, and professional domains, where it often is used to carry out tasks of relatively high importance. Both research and pedagogy in LSP writing are characterized by an increasing recognition of the social contexts which give rise to specialized writing forms. This entry examines writing in three key areas of LSP: writing needs within specific domains of language use, approaches to researching writing for specific purposes, and approaches to teaching writing for specific purposes.

Writing Needs Across LSP Domains

Needs analyses in business settings have tended to focus on oral tasks, such as meetings, phone calls, or negotiations. However, LSP scholarship that examines business writing gives some indication of the common written genres. Professional e-mails, for example, have been the focus of much research, including e-mails written for general external communication, negotiation, or replies to inquiry. One study of textile merchandisers in Hong Kong found faxing and e-mailing to be the most common channels of written communication (So-mui & Mead, 2000). Research has also studied a range of business letter types, including letters of negotiation, client letters, sales promotion letters, and job application letters. In a study of business reports in East Asian companies, Yeung (2009) identifies four common report types: review, problem-solving, market, and feasibility study.

Research into the writing carried out by business students indicates that the genres encountered in educational settings differ somewhat from those that hold importance in the workplace. One study of an English-medium business school in Lebanon found that both undergraduate students and faculty identified educational genres of in-class note taking and research papers as frequent writing tasks and the workplace genres of letters as fairly uncommon (Bacha & Bahous, 2008). Similarly, a study of writing among undergraduate and graduate students in a US-based business school identified the most common writing tasks as case analyses, article or book reports, and business reports, with letters and memos identified as relatively uncommon (Zhu, 2004).

LSP in medical and legal professions has similarly identified key written forms of communication. Although the study of the writing in these settings is not nearly as comprehensive as that of business settings, research indicates that medical research articles—and the written communication associated with the peer review system—are an important genre for medical professionals. Other common forms of writing include case histories, experimental research reports, editorials, and consensus statements (Mungra, 2007).

Within the legal profession, Bhatia (1993) has identified legal provisions or statements and legal cases as key written genres. As is the case with business students, law students interact with slightly different genres than law professionals, and it is within the context of law school that LSP is generally more relevant. In a needs analysis of law students at a university in Israel, Deutch (2003) identified the most important genres for law school

to be articles, books, court decisions, legislation, and legal documents, in that order; in contrast, legal documents were identified as the most important genre for law practitioners. In both settings, reading was considered nearly twice as important as writing. One important academic legal writing context in which both students and professionals may write is law reviews—student-run journals which publish scholarly articles, book reviews, and student-produced “notes” (Feak, Reinhart, & Sinsheimer, 2000).

Writing plays an especially prominent role in academic settings, and LSP research has centered on some of the most common and important genres of written academic communication. The academic research article serves as a central genre for advanced academic writers, representing an important means of distributing scholarship to the academic community. In many disciplinary and institutional contexts, research articles also play a key role in the evaluation of academics’ careers. Numerous other genres play a role in the network of texts that coordinate to plan, carry out, and disseminate research—for example, grant proposals, book reviews, submission correspondences, abstracts, conference papers, and scientific “short texts” that accompany research articles (Swales, 2004). Writing is also central to academics’ service roles as journal editors and reviewers and to their institutional processes of evaluation and review. For novices, an introduction to many of these genres begins in graduate school, through the writing of a thesis or dissertation—a genre that is unique in and of itself yet echoes many of the discourse strategies found in the genres of academic publication. Students must also contend with gatekeeping genres such as the personal statements that are submitted as part of school applications.

Research in Writing and LSP

One can divide research into LSP writing into four general categories: descriptions of texts; descriptions of contexts of production; descriptions of learning; and critical analyses of text production and use.

Research that describes the target texts of learners has been central to LSP since its early inception, given the goal of understanding the unique characteristics of the language that students need to learn. Such research provides important insight for needs analysis and development of LSP materials, but it also contributes to the field’s growing understanding of the ways in which language forms vary in relation to purpose and social context. Early studies of written text in LSP often examined single grammatical features in a target register, such as the use of passive voice or personal pronouns in scientific writing. With increased technology access, research in this area now tends to draw on corpus-based methodologies.

Corpus linguistics is essentially a methodology for storing and analyzing digital collections of text. Large-scale corpora, such as the British National Corpus, include tens of millions of words taken from a range of spoken and written text across registers (e.g., news, fiction, conversation, academic, business). Corpora are primarily analyzed in terms of frequency counts of target items, such as grammatical structures, lexicogrammatical features, single lexical items, or lexical bundles. Frequency counts are most often compared across registers, such as conversation versus academic writing, but can also be used to study language use diachronically.

Corpus-based research has been used in English for academic purposes (EAP) since the 1980s. Krishnamurthy and Kosem’s (2007) list of academic corpora includes collections of written texts such as academic textbooks, university student writing, theses, and published research articles; while many corpora include texts from multiple academic disciplines, some are more focused. Academic-oriented corpora often include texts from areas such as law, medicine, science and technology, natural sciences, social sciences, and the humanities. Two important corpora in written business English are the Corpus of International Business

Writing (CIBW) and the Indianapolis Business Learner Corpus (IBLC) (Upton & Connor, 2001).

Although large-scale corpora are often available for public use, compiling a corpus which suits the needs within a local LSP setting is often preferable (particularly for research tied to identifying local pedagogical needs). Smaller, specialized corpora of written texts, which can be compiled by individual researchers and practitioners with relative ease, have the advantage of producing a more focused and targeted analysis. Such corpora often target a specific genre or context of use. For instance, studies have analyzed lexical features in written business English and comparisons of grammatical structures in published and student academic writing (see, e.g., Connor & Upton, 2004).

Another significant approach to LSP writing research uses genre analysis to describe the writing in LSP domains. While corpus-based research often analyzes texts across a range of genres—such as business letters, memos, e-mails, and company reports—genre analysis aims to understand the characteristics of a single genre or an interlinked genre set. Because genres are defined by their rhetorical purposes, genre analysis (in contrast to corpus-based analysis) studies text forms from a rhetorical perspective rather than from a purely linguistic one. Of particular influence in this area has been John Swales's research on the academic research article through the identification of rhetorical moves (Swales, 1990). Move structure analysis identifies text parts that are distinguished by their rhetorical function; for instance, Swales has described research article introductions as often following a three-part move structure, in which authors first identify a topic area (the "territory" of research), next establish a niche, and finally situate their present research within that niche. Move analysis has been an extremely popular descriptive method in researching academic writing, with numerous studies describing the rhetorical structures of research articles across languages and disciplines. Move analysis has been used to explore a wide range of other specialized genres, such as business reports, letters of application, and business letters of negotiation.

Bridging corpus and genre approaches to analysis, Ken Hyland's (2004) well-known research compares patterns in lexicogrammatical and discourse structures across disciplines in written genres such as research articles, abstracts, textbooks, and book reviews. Augmenting text analysis with interviews with expert writers of the genre, Hyland goes beyond descriptions of what texts look like to also consider *why* disciplinary writers make the choices that they do. This work has been significant in the study of LSP writing in bringing a sociorhetorical lens to a linguistic description of texts.

Research into intercultural rhetoric (also known as contrastive rhetoric) has also played an important role in LSP, investigating rhetorical distinctions across cultural-linguistic groups of users. Such comparative studies draw on both corpus-based and genre analysis methodologies. Studies in this vein have included, for example, comparisons of rhetorical moves or rhetorical acts (such as criticism) across genres in two or more languages. Upton and Connor (2001) blend contrastive rhetoric, corpus analysis, and move analysis in their study of politeness strategies used in 153 letters of application written in English by American, Finnish, and Belgian writers. The researchers identified common linguistic features of politeness strategies, then searched for those features within two of the rhetorical moves (indicating a desire for further communication and expressing pleasantries at the letter's conclusion). Their study offers one example of an approach that couples hand-tagged move analysis with computer-driven linguistic features analysis, while taking into account cultural-rhetorical issues.

While the bulk of LSP writing research has studied written text, a growing strand of inquiry has aimed to describe the contexts in which writing is produced (e.g., Bhatia, 2004). Such research can offer insights for needs analysis and for building more complex understandings of the factors that shape writing and the learning of writing for specific purposes.

Surveys are often used to learn more about the types of writing carried out in a local setting; this approach is commonly used in needs analysis and curriculum development research. Interviews with people in target settings help to gain a more nuanced understanding of how the writing is shaped by contextual factors, such as community values, material resources, and various stakeholders.

While survey and interview research may be sufficient for curriculum development, more in-depth ethnographic research is often used to gain richer insight into the sociocultural influences on text production. Ethnography may incorporate surveys, interviews, and text analysis, but it generally also includes field observations. Such observations allow researchers to trace processes and practices of writing and to identify the roles and relationships that influence a community's practices. Ethnographic studies in LSP, such as Starfield's (2002) study of undergraduate writing, have demonstrated the complexities of writing that go beyond the page or screen of a text, and have highlighted the power dynamics that permeate writing contexts. Ethnographies have studied classrooms, workplaces, legal contexts, and academic research. Studies adopting this method of research have contributed to the development of more sophisticated theoretical understandings of LSP.

A growing area of research into LSP writing contexts has investigated academic publishing practices, incorporating the research methods already described: surveys, interviews, ethnographies, and case studies. Research into publishing practices has most often examined the challenges faced by the growing number of non-native English writers publishing in English as a research lingua franca. Extensive research by Flowerdew (2000), Li (2006), and Lillis and Curry (2010), for example, has shed light on the advanced competencies and intricate social interactions required for publication.

A third strand of LSP writing research investigates the learning of specialized writing. This work has important implications for LSP pedagogy, revealing some of the strategies and processes involved in learning specific genres or discourses. Case studies of LSP learners have traced their writing development over time; these studies have been particularly prominent in postsecondary academic contexts and have included undergraduate writers and graduate writers. Outside of LSP, in the field of professional writing, case studies have followed the learning of student interns and novice professional writers. Such studies (e.g., Beaufort, 1999) have highlighted the ways in which second language learners draw on mentoring, feedback, other texts, and increased involvement in a community of practice as important resources for learning.

Studies of writing development in LSP have also explored learning within classroom environments to study the effects of pedagogical approaches and the transfer of learning between LSP classrooms and actual practice. Henry and Roseberry's (1998) study, for example, used a quasi-experimental design to compare writing in a single genre by students who received genre-based instruction to that by those who did not. Drawing generalizations from such studies, however, is difficult as the studies themselves are usually limited by hours of instruction studied, when writing development is a long-term process. Other studies investigating learning transfer between LSP classrooms and "real-world" contexts have used interview methods to study student perceptions of transfer (James, 2010) and textual analysis combined with interviews to study changes in the learners' writing and beliefs about the writing (Parks, 2001). Cheng's (2008) study of learning within LSP contexts has focused on specific learners in richly described contexts and tasks, exploring the connections between their histories and goals and their analysis and production of target genres.

The three strands of research already outlined—descriptions of writing, writing contexts and practices, and learning—generally share a predominantly descriptive aim (with the exception, in many cases, of research on publishing practices). Pennycook (1997), for example, argued that the pragmatism underlying much EAP scholarship may serve to reinforce,

rather than question or challenge, the status quo, which nearly always privileges the dominance of English and the authority of the native speaker. Pennycook calls for LSP practitioners to take a more critical stance in both research and pedagogy, “think[ing] seriously about the broader implications of everything we do” (p. 266). Since the late 1990s, a growing strand of LSP research has adopted this kind of critical lens. Critical ethnographies interrogate issues such as language access and the dominance of particular languages or language varieties within a social setting. Critical discourse analysis studies how texts reflect and reinforce certain power structures; the majority of this work has examined texts that circulate in the public sphere (for example, in newspapers or other public documents), though some studies have examined LSP contexts. Sarah Benesch’s pioneering work on critical needs analysis has also been influential in LSP research. Benesch (2009) demonstrates how needs analysis, a fundamental principle of LSP, can and should go beyond a conception of learner needs as deficits toward a conception of learner *rights*. This kind of analysis can identify opportunities for learners and teachers to effect change in their local setting.

Pedagogy in Writing and LSP

LSP writing instruction occurs in a broad range of academic and workplace settings. Academic writing classrooms are the most common and include general academic writing as well as writing for specific disciplines or in specific genres, such as theses or dissertations. LSP writing instruction draws on the same principles that guide LSP pedagogy in general; that is, it is needs-driven and learner-centered, engaging students in task-based uses and analysis of authentic target language.

Since the mid-1990s, genre-based pedagogy has been a prominent approach to teaching writing in LSP. Genre-based pedagogy engages students in analysis of target genres with the goal of understanding why “specific discourse-genres [are] written and used by the specialist communities the way they are” (Bhatia, 1993, p. 11). Through consciousness-raising tasks, students learn analytic techniques that they can carry to their writing tasks outside of the classroom, and they can develop rich, dynamic theories of genres and written communication. Ann Johns has written extensively on genre-based pedagogies in undergraduate-level writing classrooms (e.g., Johns, 1997), illustrating how students can engage in ethnographic research in order to learn more about the sociorhetorical dimensions of the genres that they encounter. However, genre-based pedagogy has tended to be most popular at the very advanced, discipline-specific levels of academic writing as well as in business and legal English writing courses. Genre-based teaching has been critiqued for reinforcing existing norms, and many have acknowledged the danger that genres may be presented as static, teachable forms if instructors are not themselves familiar with the theoretical underpinnings of a genre-based approach. Nevertheless, the approach continues to be attractive to LSP practitioners who are faced with aiding student writers in developing facility with socially situated forms of writing.

Like genre-based pedagogy, corpus-based approaches to teaching LSP writing are driven by the assumption that the process of discovery, through interaction with authentic language and genres in the target setting, is valuable for developing writers. Corpus-based pedagogy is often referred to as an example of data-driven learning (DDL); in some cases, it may be able to go even further than genre-based pedagogy in identifying unintuitive language patterns. Within EAP, corpora are often used to investigate and learn academic vocabulary, but they can also be used to help students develop a greater awareness of the specialized discourse they are learning. In a 2007 special issue of *Journal of English for Academic Purposes*, several authors offer examples of corpus-based pedagogy in EAP. One such example is Hafner and Candlin’s (2007) study of law students in Hong Kong, who learned to use a corpus of legal texts as a resource for writing. The authors show that a

minority of students made use of the resource on their own, but that those who did tended to use it to examine full-length texts as models rather than analyzing the use patterns of specific lexical features. Lee and Swales (2006) describe a corpus-based course in which their doctoral students compiled corpora of their own academic writing and of published papers in their field. Throughout the course, the students learned to analyze these corpora along with the Hyland corpus. While the students reported finding the approach empowering and confidence-building, the authors concede that more studies on the effects of such an approach are needed.

Despite the potential benefits of corpus-based teaching in LSP writing classrooms, the approach is not without drawbacks. Unlike genre-based pedagogy, a corpus-based approach requires an electronic collection of texts and access to hardware and software. Both teachers and students need to learn to use the software comfortably, which itself can take some time; students may not always see the benefits as outweighing the time and effort invested in learning the technology. In some cases, teachers carry out the analyses themselves and then share findings with students. While such an approach saves time and potential frustration for students, the important element of learner-driven discovery is lost. In some cases, corpus-driven analysis may indeed be best suited for teachers, course developers, and textbook writers, rather than for students. One such example includes Robinson and Stoller's (2008) textbook *Write Like a Chemist*, which draws on extensive corpus-based analysis of chemistry writing to take students through a "read-analyze-write" sequence.

As consciousness-raising, analytic approaches, genre- and corpus-based pedagogy are easily adaptable to a range of LSP settings. In contrast, content-based pedagogy is primarily found in academic contexts. In content-based instruction (CBI), students simultaneously learn content and language, simulating the kind of learning that takes place in academic classrooms. Rather than the academic content taking on a peripheral role as a means for practicing the target language, content is front and center in a CBI classroom; language instruction helps students to access and process the content. Content-based classrooms are characterized by integration of language skills through scaffolded, content-driven tasks. For example, students in an environment-themed CBI classroom may read several articles and listen to a guest speaker talk on the topic of recycling, then synthesize the viewpoints into a graphic organizer, and finally locate an additional published source on the topic, situating its perspective within this conversation. CBI courses can go far in simulating (and therefore practicing) the kinds of writing tasks and demands that students face in their academic courses. Limitations of this approach are primarily related to the time that teachers must invest in designing such course materials (for which published textbooks are limited) and the content knowledge that teachers must bring to the subject.

As described in the previous section, LSP research has shown an increasing acceptance of critical perspectives; this trend is echoed in LSP pedagogy, with a greater interest in critical LSP pedagogy visible in the early 21st century. An early, and still significant, source on critical LSP is found in Benesch's (2001) book *Critical English for Academic Purposes*. Integrating theoretical underpinnings and practical applications, Benesch demonstrates how a critical approach can engage students in academic tasks while reflecting on and interrogating the social conditions that the tasks assume and reinforce. In the introduction to a 2009 special issue of *Journal of English for Academic Purposes* focusing on critical EAP, Benesch (2009) explains that "critical EAP considers hierarchical arrangements in the societies and institutions in which EAP takes place, examining power relations and their reciprocal relationship to the various players and materials involved" (p. 81). As issues such as learner identity, globalization, and the spread of English as a language of business, research, and education gain increased attention in language learning scholarship in general and in LSP in particular, critical pedagogy is likely to take on a growing presence in LSP writing.

Writing Development in Second Language Acquisition

ALISTER CUMMING

Three reasons may explain why research on second language acquisition has focused primarily on the development of oral rather than written language (as evidenced by contributions to the present volumes and most other related inquiries). One reason is that people develop their abilities to write primarily through education and other institutionalized activities such as work, religion, or commerce (Scribner & Cole, 1981). Consequently, writing development is highly variable and contingent on education, opportunities for learning, and needs for use. This is particularly so in second languages.

The second reason is that the fixed forms of written texts expose the complexity of discourse, making visible and requiring control over—as well as inviting analyses from—a multitude of aspects of communication that are seldom otherwise salient or needed. These include mechanical processes that learners must make automatic, such as spelling, punctuation, and word choice, as well as subtle indicators of intentionality, such as planning a message, gauging potential readers' responses, or crafting the implications of shifts in style. Indeed these concerns may be difficult to grasp or conceive, during either the rapid, fleeting exchanges of spoken conversation or the personal, interpretive processes of making sense while reading texts (Olson, 1994). Increasing recognition of the many different dimensions of writing, and the various ways it can be analyzed, makes it difficult to point toward uniform, integral dimensions of writing development, particularly in second languages. There are just so many dimensions along which writing abilities can develop. Oral interactions may be fundamental to language development from both a maturational and an evolutionary perspective, but for this reason, the wholly socially constructed nature of literacy implies that writing may be constituted, function as, and also be examined from an array of varied influences. Viewed another way, there cannot be a single, comprehensive theory of second language writing development because there are too many contradictory purposes, situations, and conceptual issues that it would have to serve.

Third, many learners of foreign languages as well as educational programs only aspire or need to develop a limited proficiency in writing, making mastery of writing less common an expectation in second language acquisition than, for example, abilities to converse or read fluently. Despite this tendency, recent decades have also seen an extraordinary growth in educational programs, research, and publications on writing in English (and to a lesser extent other international languages such as Chinese, French, and Spanish). This proliferation has arisen from increased international mobility and migration as well as emphasis on the significance of writing to display knowledge, for purposes of evaluation, and as a marker of cultural identity in education as well as for communications, both locally and globally, about specialized technologies and in various forms of work.

These basic characteristics have shaped but also complicated the approaches to research on writing development in second language acquisition. On the one hand, most research has focused on specific social contexts—often educational but also vocational or other institutional settings—within which writing development in second languages can be expected to occur (Leki, Cumming, & Silva, 2008). Such research tends necessarily to

involve small-scale, holistic case studies, analyzing the performance of particular populations on a restricted set of writing tasks. On the other hand, this research has addressed an enormous range of different variables, all of which relate in some ways to writing development in second language acquisition. But the nature or strength of these relationships remains uncertain. Moreover, the relationships are inherently complex because of the many variable conditions and sequences under which both literacy and second language proficiency may develop in an individual. These relationships may differ for particular combinations of languages and print media and by their functions in societal contexts (Hornberger, 2003). For these reasons few assertions can be made about writing development in second language acquisition generally other than to acknowledge that it occurs, varies, and is multifaceted. But just as written texts encode and make visible features of discourse, the phenomenon of second language acquisition reveals aspects of the complexity and situated nature of writing, languages, human development, and societal communications that may not be obvious within the norms of a single language or cultural context. The remainder of this entry elaborates on these fundamental issues, explaining how the burgeoning inquiry into writing development in second languages has been synthesized, while highlighting notable studies and relevant findings.

Hornberger (2003) put forward a conceptually oriented framework that demonstrates the inherent complexity and variability of what she called biliteracy (i.e., literacy in two languages, involving both reading and writing), evident in the broad scope of inquiry and phenomena related to both bilingualism and literacy. Hornberger distinguished three interrelated sets of continua along which the development of biliteracy tends to vary, and within which additional sub-continua are nested. The first are social contexts of biliteracy, which have micro and macro dimensions in terms of social interaction and levels of analysis; oral as well as literate dimensions that vary in dominance across and within contexts; and differences between situations where either monolingual, bilingual, or multilingual norms operate. The second set of continua concerns the development (or loss) of biliteracy over the lifespan of individuals, during which three dichotomous tendencies may play out in various ways. These involve distinctions but also inherent dependencies between language reception (reading, listening) and production (writing, speaking), between the status and uses of oral and literate forms of communication, and through transfer between a person's literate skills, practices, and expectations developed in first, second, and additional languages. Interrelated with these two sets of continua is a third set of continua involving the media of two or more languages in communication. Individuals may experience bilingual uses of literacy either simultaneously or in successive phases during different points in their lives. Combinations of languages and of their scripts tend either to converge or diverge or to be similar or different, also influencing the relative ease or difficulty of the development of biliteracy. In sum, Hornberger shows how and why writing development in second languages should be expected to be variable and complex rather than uniform.

Addressing the voluminous research on writing in English as a second language appearing since 1975, Leki et al. (2008) took an emergent, grounded approach to categorize themes and findings evident in this inquiry. This analytic approach is akin to earlier syntheses such as Grabe and Kaplan (1996) or Kroll (2003) or a recent synthesis of research on writing in distinctly foreign-language settings in Manchon (2009). Leki et al. (2008) distinguished three perspectives from which second language writing development has been investigated. The first is defined by institutional contexts and categories of learner populations. Relatively distinct sets of inquiry have investigated either young writers in primary schools, adolescent writers in secondary schools, young adults in undergraduate or college programs, or mature adults either in graduate programs, adult literacy or resettlement programs, workplace settings, or scholarly or professional contexts. Findings about development in these

studies tend to show young writers accommodating biliteracy with apparent ease; adolescents doing so while struggling with issues of identity, relocation, and marginalization; and adults acculturating gradually into either adopting or resisting new educational, work, or community roles that involve writing.

Elaborating on the pragmatic, educational purposes of most research on second language writing development, Leki et al.'s (2008) second perspective highlights issues in curriculum, instruction, and assessment. Educational and developmental issues in second language writing have been informed, though eclectically, by conceptual foundations from linguistics, psychology, and rhetoric as well as analytic frameworks such as genre theory, discourse or text analysis, cognitive problem solving, language socialization, critical pedagogy, or multiliteracies. Instructional approaches that may influence second language writing development vary with curriculum contexts, organization, and purposes; teachers' knowledge and beliefs; and modes of classroom interaction. Approaches to assessment that may influence second language writing development serve either pedagogical or institutional purposes (but seldom both effectively at the same time). Pedagogical purposes tend to involve informal, locally determined modes of formative assessment within educational programs, for example, needs assessment to inform curriculum planning, teachers responding to certain aspects of students' written compositions in varied ways, or peer or self-assessment among students. Institutional purposes involve the use of formal tests of writing abilities for selection or placement into programs, certification of program completion or abilities for employment or immigration, or the monitoring of educational systems (for accountability or system-wide improvement).

The design and validation of high-stakes English proficiency tests has prompted considerable research into the qualities and characteristics of writing development among second language learners. This inquiry has adopted three different but complementary approaches. One approach has focused on defining needs for writing in educational settings either through surveys or analyses of corpora of written texts. From this viewpoint, development is conceived either as perceptions of what students need to be able to do with writing or of the formal text or genre features they need to acquire. The second and most prevalent approach has involved analyzing the discourse characteristics of written texts at different score points on a test (e.g., Jarvis, Grant, Bikowski, & Ferris, 2003). Development from this viewpoint is conceived as successive improvements in multiple dimensions of written texts, ranging from vocabulary to syntax to rhetoric. The third approach acknowledges the central role of assessors in judging the quality of written texts so has analyzed their mental and collaborative processes of decision-making while evaluating written compositions. Development from this third viewpoint is conceived in reference to the skilled interpretations and judgments of experienced evaluators of writing in second languages. Distinctions in these three research approaches, as well as their findings, again emphasize the variability and multifaceted complexity of writing development in second languages.

The third perspective that Leki et al. (2008) took up in their synthesis was to identify the many variables that published research has demonstrated to impact on writing performance in second languages. These variables group broadly as the characteristics of (a) second language writers, (b) their composing processes, and (c) their written texts. These characteristics involve an enormous array of variables, most of which may plausibly be interrelated. But the relations between writing performance and writing development have not been demarcated definitively in respect to second languages, so the status of the relations among these variables remains unclear.

From the perspective of individual characteristics, research shows writing performance in second languages to be influenced by abilities both in the first and second languages, as evidenced in Cumming's (1989) distinction between writing expertise and second

4 WRITING DEVELOPMENT IN SECOND LANGUAGE ACQUISITION

language proficiency. This primary distinction occurs in relation to a host of facilitating or constraining variables such as grammatical, vocabulary, or metalinguistic knowledge; various psychological constructs including motivation, affect, learning style, and identity; as well as task conditions, genres, prior education, and present educational contexts.

These same general variables obtain in studies of composing processes, but research on composing has focused on learners' cognitive and behavioral practices during phases of planning, drafting, revising, and editing written compositions as well as facilitating psycholinguistic subprocess of transfer, translation across languages, idea generation, planning, restructuring, goal setting, and self-monitoring. Likewise, from the perspective of written texts, research has identified diverse influences on multiple aspects of written discourse, including variable influences of first languages on second languages, text types or genres, communication functions, rhetorical patterns, as well as age, gender, and cultural differences. At a microlevel of language systems, considerable research has also investigated either the development of syntax or vocabulary in texts written in second languages or adopted a comprehensive perspective such as the rubric of fluency, complexity, and accuracy common to analyses of oral discourse in second languages.

Suffice it to say, in conclusion, that the multifaceted complexity and social dynamic of writing development in second languages are firmly established. The question to pose now is: What directions hold promise for explaining these relations further as well as for making practical use of their implications? For explanatory as well as pragmatic purposes, inquiry needs to continue to pursue theoretically informed analyses of the multiple dimensions of writing development in second languages, linking both the micro and macro aspects of social contexts with analyses of patterns in learners' development, effective teaching/learning interactions, and institutional policies. Notable examples, worthy of emulation and extension, have appeared in studies of the factors influencing individual choices to develop effective, biliterate identities in higher education (Gentil, 2005; Leki, 2007) as well as the routine processes that facilitate such development through literate classroom interactions (Perez, 2004), teacher–learner discourse (Nassaji & Cumming, 2000), or peer apprenticeship in workplaces (Parks & Maguire, 1999).

Educators, especially, also need to be mindful of educational policies or practices that can impact negatively on learning opportunities (e.g., teachers' excessive error correction), to evaluate the affordances for second language writing development and assessment provided by new technologies and multimedia, and to determine whether and how abilities taught in writing courses for language learners actually transfer to writing practices in other contexts (James, 2009). For instructional practices, educators should aim to prompt students' writing development in second languages by extensive writing, as well as purposeful, judicious responses to that writing (Hyland & Hyland, 2006), through extensive reading and vocabulary development in the second language (Albrechtsen, Haastrup, & Henriksen, 2008), by modeling relevant text types and discourse interactions (Schleppegrell & Colombi, 2002; Hyland, 2004), by enhancing students' self-control over their composing and learning processes (Cumming, 2006), and by organizing curricula and assessments appropriate to learners' abilities, purposes, and interests (Grabe & Kaplan, 1996).

Young, Richard

HANH THI NGUYEN

Richard Frederick Young was born in London on October 15 in 1948. After graduating from Oxford with a degree in philosophy, politics, and economics, he taught at the University of Turin, then returned to England to earn a master's degree in applied linguistics from the University of Reading. He was with the British Council in Hong Kong as Materials and Methodology Officer before settling in the United States in 1983. Young earned his PhD in educational linguistics from the University of Pennsylvania in 1989, with a dissertation that was the first extension of quantitative variation theory to interlanguage. He then taught at Southern Illinois University at Carbondale until he joined the faculty at the University of Wisconsin-Madison in 1993, where he is currently Professor in English Linguistics and Second Language Acquisition. Young has also held visiting professorships at Pennsylvania State University, International Islamic University of Malaysia, and two universities in Germany.

Richard Young is known for his works on interactional modifications of input, variation in second language acquisition, social interaction in oral proficiency tests and, most recently, discursive practice theory. An overarching theme in Young's research is the dynamic relationship between the use of language and the social contexts that language reflects and creates. His research has focused on change—how newcomers learn to participate in the practices of a new community. Young's work crosses conventional boundaries between academic fields to bring interdisciplinary insights to issues of second language learning. His research has been published in three single-authored books, one edited volume, and over 50 journal articles and anthologies in applied linguistics.

Young's curiosity about social interaction and language learning began with his research on the role of interactionally modified input and negotiation of meaning. Working both collaboratively and independently (Pica, Young, & Doughty, 1987; Young, 1988), Young built on the concept that input is better comprehended when it is modified in interaction through negotiation of meaning than when it is premodified for learners. Pica, Young, and Doughty's coauthored article in *TESOL Quarterly* was reprinted a few years later, in 1994, and the study continues to inform researchers working on the nature and role of comprehensible input in second language acquisition.

Young's focus on contextual factors in second language acquisition then turned to the area of variation. His (1991) study of plural marking by Chinese learners of English pioneered the utilization of a multivariate model in order to simultaneously examine several linguistic and social factors that may lead to variation in interlanguage and to determine the relative weight of each of the factors being considered. This approach advanced the field by providing a richer and more adequate description of learners' interlanguage compared to previous studies, which sometimes had found conflicting results because of a more limited focus on one single factor at a time. Young discovered, for example, that interlanguage development, linguistic environment, and communicative redundancy were factors influencing the learners' plural marking, but the ethnicity of the interlocutor had little influence. In addition to studying the variation of plural marking, Young has also investigated variation in learners' production of other morphemes, including articles, copula, past-tense marking, progressive marking, and third person singular (Young, 1986,

1996). Methodologically, Young's employment of the computer software VARBRUL (originally developed by Henrietta J. Cedergren and David Sankoff in 1974) also helped introduce applied linguists to a powerful tool to analyze systematic variation in learner language (e.g., Bayley & Preston, 1996). The lasting relevance of Young's research on the influence of contextual factors on interlanguage production can be seen in the fact that it is referenced in most current standard texts on second language acquisition.

Young's interest in variation extended to investigations of discourse variation in oral proficiency interviews, which was presented in an influential coedited volume with Agnes He (1998), *Talking and Testing: Discourse Approaches to the Assessment of Oral Proficiency*, and several articles (Young & Milanovic, 1992; Young, 1995, 2002). Young's approach combines discourse analysis and language assessment and results in some of the earliest empirical discourse analyses of interactions designed to assess spoken English proficiency. By looking at oral proficiency as both tests and texts, researchers were able to observe phenomena that are crucial for testing practice. For example, in an analysis of language proficiency interviews with Mexican and Japanese learners of English of different levels, Young and Halleck (1998) found that the learners' discourse patterns during the standardized interviews might have been influenced by their native languages, their personalities, and proficiency levels. Importantly, a learner may be rated below his proficiency level when his interlanguage discourse patterns are perceived negatively by the interviewer. A significant contribution of this volume is He and Young's (1998) outline of the slippery construct of *interactional competence*. They defined it as being co-constructed, practice-sensitive, and including the following components: rhetorical scripts, specific lexis and syntactic structures, strategies for managing turns, management of topics, and discourse devices for signaling boundaries. This conceptualization of interactional competence provides a useful framework for several studies on the development of interactional competence (e.g., Young & Miller, 2004; Hellermann, 2006, 2007, 2008; Nguyen, 2006, 2008) and later became an important part in Young's theorization of discursive practice.

Young's theory of discursive practice (2007, 2008, 2009) is a culmination of his empirical studies and theoretical reflections on language and context. In this theory, Young brought together insights from an eclectic range of fields—including the philosophy of language, linguistic anthropology, sociolinguistics, systemic functional grammar, conversation analysis, critical applied linguistics, and sociocultural theory—in order to provide a comprehensive and coherent description and discussion of the dynamic and reflexive relationship between language and context in social interaction, and how this understanding comes to bear on language learning and teaching. Young defined practices as episodes of social interaction that entail "the construction and reflection of social realities through actions that invoke identity, ideology, belief, and power" (2008, p. 1). Discursive practices, by extension, are practices that involve language. Resting on the notions that language reflects and creates context and context comes into being through language use, Young conceptualized discursive practice theory as aiming to "explain the ways in which the global context affects the local employment of resources and vice versa" (2008, p. 3). Drawing from his earlier studies of variation and oral proficiency tests as well as his more recent works on modes of meaning in a science class (Young & Nguyen, 2002), performance of listenership in social interaction (Young & Lee, 2007), and the role of affect in second language acquisition (Garrett & Young, 2009), Young vividly described the multiple aspects and layers of context from linguistic, ethnographic, emotional, and political perspectives as well as the specific verbal and nonverbal resources involved in discursive practices. What is particularly relevant for research on second language acquisition is Young's thought-provoking discussion about how the abilities to participate in a discursive practice may be learned, taught, and assessed.

In addition to his own research, Young was the editor of the interdisciplinary *Language Learning Monograph Series* from 1994 to 2006. During this time, he was the series editor of five volumes by leading authors in the field, covering the topics of language testing (Tim McNamara & Carsten Roever, 2006), classroom interaction (Paul Seedhouse, 2004), pragmatic development in a second language (Gabriele Kasper & Kenneth Rose, 2002), tense and aspect in second language acquisition (Kathleen Bardovi-Harlig, 2000), and affect in language learning (John Schumann, 1998). These volumes report on current theories and recent findings with forward-looking perspectives on future developments in the field. Young has also been on the editorial boards of three major journals, *Language Learning*, *Studies in Second Language Acquisition*, and the *Journal of Applied Linguistics*, and he recently became the editor of another book series, *Trends in Applied Linguistics*. During 2005–6, he served as President of the American Association for Applied Linguistics and chaired the 14th World Congress of Applied Linguistics in Madison, Wisconsin. Up until 2004, he served as a consultant to the Educational Testing Service during the major redesign of the TOEFL (Test of English as a Foreign Language).

Zarate, Geneviève

ALINE GOHARD-RADENKOVIC

From the early 1980s, Geneviève Zarate has researched an area of study that had hitherto been unexplored, namely the teaching of foreign cultures in language tuition. Up to that time, the main emphasis had been on the presentation of a thematic, often simplistic, if not stultified, vision of a “civilization.” In her book *Enseigner une culture étrangère* (1986), Zarate formally positioned the teaching of culture within the didactic area of foreign languages. Furthermore, she elaborated a new area, presenting it as a theoretical structure within the domain of language teaching, characterized at the time by communicative trends.

The fundamental concept of this new area was the development of a cultural competence in a foreign culture. The basic principle was that the social actor’s sense of “belonging to” evolves from the infinitely small aspects inherent in social facts, such as those implicit in everyday life, social codes, the shared givens within a society, all of which ground our relationships to self, to one’s group, to the world, and to otherness. She highlights that this set of references is not only barely accessible to a foreigner, but to natives themselves, who are rarely aware of the rules that preside over their social practices. The question that arises from this principle is the following: How can one activate the learners’ consciousness of those who consider a foreign culture from a naive perspective, through the prism of their primary grounding and their own sociological lenses? The author advocates a dialectical approach to a foreign culture, arising from a critical look at one’s own culture and at the processes presiding over cultural acquisition, and suggests three main guiding principles: (a) *to become aware* of the impact of ethnocentrism; (b) *to identify the representations* that contribute to one’s identity development, both personal and collective—representations of time (e.g., national history in school manuals) and representations of space (e.g., images representing other places such as maps in an atlas); (c) *to initiate learners* to an anthropological reading of authentic documents so as to drive out stereotypes and underlying ideologies.

Throughout her writings, Zarate advocated that the contextualization of cultural facts under study is vital. The originality of her work is that she did not start from preconceived notions such as “tolerance,” “respect,” or “openness to otherness,” deemed to be ideological traps that hypothesize in each learner a preexisting openness, but conceived a systematic questioning of learners’ identities, values, and worldviews such as can be found in public discourse, schoolbooks, and pedagogical practices (see Zarate, 1993). The didactic approaches suggested by her seek to make the crossing from one culture to another explicit. They present a systematic approach to cultural analysis which consists in looking at one’s viewpoint and experience as objectively as possible, in crossing the bridge between knowing and knowing how to interpret through speculative observations, and in learning to think the unthinkable in a distant culture. The overriding objective is to appropriate a rational, liberated approach, on the same methodological principles as ethnology and geopolitics, that intensify and confront the viewpoints of the participant observers and the effects of national socialization.

Zarate brought about a paradigmatic change in terms of the grammar of complexity that deeply transformed thinking in this area. Her positions were given further substance in her recent work (Zarate & Byram, 1998; Zarate, 2003; Zarate, Gohard-Radenkovic, Lussier,

& Penz, 2004; Zarate, Lévy, & Kramersch, 2011). Contrary to present trends which favor the assessment of intercultural competences through an itemized grid, she advanced the concept of acknowledgment of these competences and their identification in a spatial and symbolic mapping of individual movements (Zarate & Gohard-Radenkovic, 2004), using as a basis of the analysis the biographical stories and data revealed by those who have experienced sociocultural otherness or unacknowledged multilingual competences.

Zipf's Law and Vocabulary

C. JOSEPH SORELL

In the 1930s, George Kingsley Zipf observed that a few very frequent words make up a very large portion of any text or collection of texts, while the large majority of words occur relatively rarely. The same observation had been made earlier by Estoup (1916), a stenographer at the French Parliament. However, the phenomenon is more often associated with Zipf because of his outspoken advocacy of the law's significance. Indeed, Zipf's law is of obvious importance to language learners, teachers, and researchers as they choose vocabulary items on which to focus.

Zipf (1949) proposed that if one arranged the words from a text in descending order of frequency, beginning with the most frequent and continuing to the least frequent word in the text, one would find that the second word occurred roughly half as many times as the first word, the third word occurred roughly one third as often as the first word, and so on. This would mean that if one multiplied the rank of a word r (rank 1 being the most frequent) by its frequency f (how many times the word occurred in the text), the product C would remain approximately the same for each word, as can be seen in Table 1.

$$r * f = C$$

Table 1 Ranks and frequencies for James Joyce's *Ulysses* (Zipf, 1949, p. 24)

<i>Word type</i>	<i>Rank (r)</i>	<i>Frequency (f)</i>	<i>Product (C)</i>
's	10	2826	28260
is	20	1435	28700
what	30	975	29250
one	40	739	29560
so	50	618	30900
has	100	289	28900
wife	200	140	28000
Ireland	300	90	27000
nose	400	65	26000
since	500	52	26000
college	1000	26	26000
allow	2000	12	24000
fever	3000	8	24000
instruction	4000	6	24000
morn	5000	5	25000
builder	10000	2	20000
gauntlets	20000	1	20000
Zurich	29055	1	29055

2 ZIPF'S LAW AND VOCABULARY

Zipf's law, then, is that there is an inverse proportional relationship between the rank and frequency of words in a text. Therefore, Zipf also argued that the proportion of a text made up by words with a certain frequency should equal

$$\frac{1}{f(f+1)}$$

Starting from the low-frequency end of the list, approximately half the words (types) in a text should occur only once. About one sixth of the words in a text should occur twice, and around one twelfth would occur three times in a text. This second method is sometimes called Zipf's second law, but both methods create the same distribution.

A Double Logarithmic Transformation

Since word frequencies decline so rapidly, a graph of them would show an L-shaped line that hugs the x - and y -axes. In order to see the descending slope more clearly, frequencies are usually plotted on a double logarithmic graph (see Figure 1). By using the logarithm of each frequency, the line is bent upward and compressed into an almost straight line from the top left to the bottom right of the graph. The horizontal lines seen toward the bottom of the graph are places where many words are tied for the same rank.

A Zipfian distribution of words appears to be universal in natural language. It emerges in the speech of children less than 32 months old (Ninio, 2006, p. 131), and is also found in the specialized vocabulary of university textbooks. Coxhead (2000) found a group of 570 terms common to a wide range of academic subjects. These terms were arranged in 10 sublists according to the words' frequencies. The number of words in an academic

Figure 1 A double logarithmic graph of the word frequencies in the Brown Corpus (Kučera & Francis, 1967). Each type is represented by a circle. The solid line shows the angle predicted by Zipf's law. Zipf-Mandelbrot is explained below.

Table 2 Coverage of the Academic Word List (Nation, 2001, p. 190)

<i>Sublist</i>	<i>Number of words</i>	<i>% coverage</i>	<i>Number of tokens per 350-word page</i>
1	60	3.6	12.3
2	60	1.8	6.0
3	60	1.2	4.2
4	60	0.9	3.2
5	60	0.8	2.7
6	60	0.6	2.4
7	60	0.5	1.7
8	60	0.3	1.3
9	60	0.2	1.0
10	30	0.1	0.5
<i>Total</i>	570	10.0	35.1

text typically covered by each list shows a nearly perfect Zipfian distribution. The second list covers half as many as the first, the third covers one third that of the first, etc. (see Table 2).

Power Laws

Long before this proportional relationship had been noticed in language, Pareto (1896–7) observed a similar pattern in the wealth of individuals in a country. Approximately 20% of the people possess around 80% of the wealth. Auerbach (1913) found the same rank–size relationship in the populations of cities in a state or country. These highly skewed patterns are known as power law distributions. More recently, the size of moon craters, the magnitude of earthquakes, the number of hits received by Web sites on the Internet, and many other cases have all been found to follow power laws (Newman, 2005, p. 325).

Zipf–Mandelbrot

As was seen in Figure 1, the descent of word frequencies is not a perfect 45° slope. Natural language data usually deviate at both the high- and low-frequency end of the distribution. In 1951, Mandelbrot wrote a modified version of Zipf's formula. He added three parameters (adjustable values), which curve the originally straight line of Zipf's formula to better fit natural language data (Mandelbrot, 1982, pp. 341, 343–5). The parameters are shown here as the Greek letters α and β . The third parameter is an adjustment to C to compensate for adding α and β . Otherwise, the quantity on right side of the equation would no longer equal f , the sum of the word frequencies.

$$f = \frac{C}{(r + \beta)^\alpha}$$

In Table 1, if we multiply each word's rank by its frequency, we see that the constant C for Joyce's *Ulysses* should be approximately 26,000. Therefore, we would expect the word with rank 1 to have a frequency of around 26,000. However, the most frequent word, *the*,

was deliberately not shown in Table 1, because it actually occurs only 14,954 times. Mandelbrot's formula allows us to add a value β to the value for rank. In this case, if the value of β were 0.75, the Zipf-Mandelbrot formula would predict that *the* should occur only 14,857 times, since now we are dividing the constant by 1.75 instead of by 1.

While parameter β helps to lower the predicted curve for the most frequent words, it has little effect on less frequent words. "College" at rank 1,000 occurs 26 times, and Zipf-Mandelbrot with $\beta = 0.75$ would predict it should be 26.03. The exponent α shapes the angle of the slope. Of course, the parameter settings should be based on the entire distribution. In Figure 1, $\alpha = 0.58$ and $\beta = 0.002$. At first glance, this curve seems to deviate considerably from the observed data. Since the graph is logarithmic, the first increment on the x -axis (far left) represents only 10 words, while the last increment (far right) contains many thousands. Despite underestimating or overestimating the most frequent words, this curve is a good fit for most of the 45,215 word types in the Brown Corpus. (Credit goes to Baroni, 2009, p. 817, for a clear explanation of these parameters.)

Mechanisms

Since researchers became aware of power law distributions, a lively debate has raged over what causes them. Zipf (1949) saw communication as competition between speaker and listener. The speaker, he imagined, would want to expend the least possible effort by encoding all the meanings in a message into a single word, while the listener, wanting to expend the least possible effort in decoding the message, would want each meaning to have a separate word. Zipf saw the distribution of words we see in texts as an effective compromise between these two opposing positions. Though the mechanism he described is unrealistic in view of what is now understood about discourse, Zipf did correctly observe that the words in a language are part of an efficient communicative system.

Mandelbrot, whose work on Zipf's law started him on the path toward the discovery of fractal geometry and chaos theory, saw communication in terms of information theory (Shannon, 1948). Rather than the speaker and listener being viewed as in opposition, the lexicon of a language is seen as poised between the need to maximize information transfer and to minimize the cognitive cost of retrieving or recognizing a word. Mandelbrot (1953) argued that such an optimal code would result in a Zipfian distribution. In this context information should not be viewed strictly as "facts." From a linguistic perspective, signaling group identity or one's emotional state by selecting a particular word is also a kind of information.

Simon (1955), a pioneer in artificial intelligence and complex systems theory, created a competing model based on the principle of preferential attachment, often described as "the rich get richer." Popular Web sites attract even more hits. People with many friends tend to make even more. Function words that are part of frequent constructions, words related to the topic of a text, and other commonly used words will all have a better chance of being recycled in a text than other optional words.

Both Mandelbrot's and Simon's models included the assumption that word generation is random. Mandelbrot's "intermittent silence" model, for example, relies on the random generation of characters from an alphabet, one of which is a space character. The computer randomly emits characters until the character chosen is a space. The resulting string of letters then becomes a "word." If a random process produces a Zipfian distribution, one might conclude that it is not related to meaning or the structure of language. Therefore, many have judged Zipf's law to be "linguistically very shallow" (Miller, 1957; Mandelbrot, 1982, p. 346). However, Ferrer-i-Cancho and Elvevåg (2010) clearly show that the distributions in random texts are quite unlike those found in natural language.

While investigating the structure of the Internet, Barabasi (2003, p. 153) found that several "coexisting mechanisms delicately balance each other" and thus maintain a power law distribution of links. One of the most important, namely preferential attachment, builds a robust network with many well-connected hubs. Well-connected, high-frequency words in a Zipfian distribution have been described as lexical hubs (Ferrer-i-Cancho & Sole, 2001). However, words (like Web sites) do not stay on top forever. Conversation topics, speakers, and languages all change.

The optimum arrangement Mandelbrot's model envisioned can then be dynamically maintained by another phenomenon: self-organized criticality (Bak, 1996). Self-organized criticality describes systems that are neither too rigid nor too independent, like the sand at the bottom of an hourglass. As sand flows in from the top, it causes frequent small, but sometimes very large avalanches. Nonetheless, the angle of the pile remains roughly the same due to the friction between the grains.

Similarly, the elements of a network need to be balanced between complete independence and complete interdependence. If a network is too interdependent, the signal will spread too far and the response will be very costly. For example, a call to the Fire Department that a cat is stuck in a tree should not result in the mobilization of the city's entire fire brigade. On the other hand, if the elements of the system are too independent, the call might go unanswered. In conversation, a speaker selects the least costly (usually the most frequent) words to convey the desired information. Dropping down to more costly (less familiar) words may occasionally be necessary to fulfill certain communicative objectives, but they come at a cognitive cost to both speaker and listener, and the results may not always be predictable.

Implications

In the world of linguistics, Zipf's law is one of the most imposing topographical features. For language learners and teachers, this means that "a little bit goes a long way," which is a major motivation for the creation of learning materials with a controlled quantity of vocabulary (Nation, 2001). It also means that more advanced vocabulary learning will be more gradual. Researchers designing models and studies of first and second language acquisition will need to contend with the fact that exposure to many vocabulary items is highly infrequent. Lexicographers looking for examples of word usage, designers of natural language processing systems, and corpus linguists building parsers and taggers will all face this same challenge. Encouragingly, research into systems characterized by power laws is bringing together academic disciplines as never before. In applied linguistics, a unifying vision is now emerging of language as a complex adaptive system of which the lexicon is a central element (Larsen-Freeman & Cameron, 2008).

Zone of Proximal Development in Second Language Acquisition

STEVEN G. MCCAFFERTY

What Is the Zone of Proximal Development (ZPD)?

At this date the popular educational zeitgeist has taken the ZPD to be the centerpiece of Vygotsky's theory of mediation with regard to teaching and learning. However, the ZPD was one of the last constructs Vygotsky worked on, only first appearing in the last year of his life, and there are only eight extant references to it in the totality of his writings (Chaiklin, 2003). This being said, its enormous appeal for researchers and educators is immediately recognizable in the quote that is most cited as definitional:

What we call the Zone of Proximal Development . . . is the distance between the actual developmental level as determined by independent problem solving and the level of potential development as determined through problem solving under adult guidance or in collaboration with more capable peers. (Vygotsky, 1978, p. 86)

The potential for understanding learning and development immediately springs to life in this brief quotation. Indeed, it would appear to contain the seeds of a fully developed theory in and of itself, and its application to how people develop a second or other language is also readily apparent as an aspect of interaction. But it is of course left underspecified on many accounts. The incomplete nature of Vygotsky's writings on the concept has of course led to some confusion, but Glick (2004, pp. 352–4), also argues that the different translations of Vygotsky's works into English in the West have had a major impact on scholars as well, especially with regard to his two most popular works: *Thought and Language*, which first appeared in 1962, was reedited in 1986, and later translated as *Thinking and Speech* (1987), and a collection of his papers published together in one volume under the title of *Mind in Society* (1978).

Glick (2004) notes that there are only two pages that contain mention of the ZPD in *Thought and Language* (Vygotsky, 1962), and in this text the ZPD is largely treated as a refined diagnostic instrument, meant to materialize/measure the potential of the child in comparison to the actual level of development. It is also the last word Vygotsky had to say on the ZPD, as the work was published posthumously. Vygotsky and his colleagues were convinced that the standardized intelligence testing of the time (Binet's model) did not reveal what a learner was truly capable of, that two children with the same test score (independent level of development) might have different levels of potential. This discrepancy led to the ZPD, but the concept must also be seen as part of Vygotsky's profound understanding of the dialectic of learning and development (that the two are not dualistic) and, indeed, this is at the heart of the ZPD. Later, Vygotsky came to focus on the application of the ZPD to the learning/teaching situation as carried out in classroom activity, and largely as related to what we consider special education today. Vygotsky considered imitation in addition to instruction to be crucial to development in the ZPD as well, especially with regard to first language development:

2 ZONE OF PROXIMAL DEVELOPMENT IN L2 ACQUISITION

In the child's development . . . imitation and instruction play a major role. They bring out the specifically human qualities of the mind and lead the child to new developmental levels. In learning to speak, as in learning school subjects, imitation is indispensable. What the child can do in cooperation today he can do alone tomorrow. Therefore, the only good kind of instruction is that which marches ahead of development and leads it; it must be aimed not so much at the ripe as at the ripening functions. (1986, p. 188)

Furthermore, Vygotsky did not include learning on its own; instead, the original Russian term he employed for classroom contexts was *obuchenie*, which is best translated, according to Cole (2009), as "learning/teaching," a term he himself employed in his own early translations. Within this context there also is a heavy concentration on concept development, particularly in relation to Vygotsky's seminal work in this area. However, Chaiklin (2003, p. 57) contends that such an interpretation is too narrow, that Vygotsky focused on development from a larger frame as related to the development according to "age periods."

One of the clear shortcomings of Vygotsky's writings on the ZPD is the fact that he did not indicate how the teaching and learning of concepts or other forms of development should be undertaken. In part, this circumstance explains why so much attention has focused on the concept of "scaffolding," which over the years has become heavily intertwined with discussions of the ZPD. Scaffolding as it is widely known today is credited to Wood, Bruner, and Ross (1976), who introduced a set of six guidelines for successful scaffolding on the part of a tutor: (a) recruiting the tutee's attention, (b) reducing degrees of freedom in the task in order to make it manageable, (c) keeping direction in terms of the goals, (d) marking critical features, (e) controlling frustrations, and (f) modeling solutions.

In *Mind in Society*, in contrast to *Thinking and Speech*, the ZPD is given its own heading. In this volume, which includes writings from different time periods in his career, Vygotsky not only contrasts what the child can do on his or her own to what s/he can do with the help of adults or more capable peers (the quote above), but includes peers as well, and expands the zone to have a more collective sense—people in interaction with others as an aspect of cultural historical development:

We propose that an essential feature of learning is that it creates the zone of proximal development; that is, learning awakens a variety of internal developmental processes that are able to operate only when the child is interacting with people in his environment and in cooperation with his peers. Once these processes are internalized, they become part of the child's independent developmental achievement. (Vygotsky, 1978, p. 90)

Holzman (2009) applies both these elements to the structure of the ZPD in examining Vygotsky's thinking in relation to play and work, her ideas stemming in part from the following quote from Vygotsky (1978, p. 102), "[P]lay creates a zone of proximal development of the child. In play a child always behaves beyond his average age, above his daily behavior; in play it is as though he were a head taller than himself." Vygotsky's "law of cultural development" also appears in the 1978 volume: "Every function in the child's cultural development appears twice: first, on the social level, and later on the individual level" (1978, p. 57). Moreover, it is the transformation of thinking through cultural practices and contexts, as illustrated by his central claim that psychological development is transformed by the process of moving from the intermental to the intramental plane, that pervades Vygotsky's overall theory. According to Newman and Holzman (1993, pp. 39–40), it is highly significant that Vygotsky in *Thought and Language* (1986, p. 3) chose to use an epigraph from Francis Bacon regarding the nature of both psychological and physical tools: "neither hand or mind alone suffice; the tools and devices they employ finally shape them." This is a decidedly revolutionary and transformational view of people in the world and

processes of mediation, and is completely compatible with his overall approach in *Thinking and Speech*, as well as that in *Mind in Society*. Vygotsky's view of development is also relevant here (1978, p. 73) as it is not linear or lockstep.

Glick (2004, p. 356) also makes it clear that the two translations under consideration are problematic beyond the different lights they shine on the interpretation of the ZPD, citing the translator's note for the 1962 volume, which suggests that Vygotsky's original manuscript was prepared in haste (he was dying) and the inner structure of the book (i.e., what holds it together) is not readily seen. Moreover, parts thought unnecessary for the contemporary reader (ca. 1934–5) were culled, and there was an overall attempt to keep the style of writing more direct, Vygotsky having had a tendency to provide convoluted explanations. The 1978 volume is problematic as well, being a collection of different pieces from Vygotsky's work that were combined on the basis of what the editors chose to include for their purposes. It is clear that both volumes were shaped by considerable influences apart from Vygotsky's own hand.

The Application of the ZPD to Second Language Development

Research on the ZPD in applied linguistics is basically an extrapolation of Vygotsky's work with children. Frawley and Lantolf (1985), in an effort to address this difference, argued for what they termed "the Principle of Continuous Access," finding that adults often return to ways of knowing developed in childhood, particularly in the forms of object-, other-, and self-regulation in their problem-solving pursuits. The ZPD was not a particular focus in this early work, however, and started to receive specific attention in the 1990s. Since that time there have been a fairly large number of studies specifically devoted to the topic, some of which are discussed below. The sections that follow are organized under the division explored above.

The first set of studies focuses on operationalizing the "proximal" component of the ZPD as an aspect of dynamic assessment through both microgenesis (tracking development over short periods of time—typically within one session of interaction) and macrogenesis (looking at development over days or weeks in a more longitudinal fashion, in accordance with the volume *Thought and Language / Thinking and Speech*). The second set of studies depicts a wider application of the ZPD as found in *Mind in Society*, and also employs micro/macrogenetic forms of investigation, although many focus exclusively on microgenesis, and by and large concentrate on interaction with peers or more capable others in connection with sociogenesis as a whole. Moreover, all the studies in both sections include a focus on metalinguistic awareness/knowledge (concept development) as a fundamental building block of second language development. The role of imitation, particularly with regard to play, is also brought out. Before turning to the studies, however, two L2 articles that are not studies but address the ZPD should be mentioned.

Kinginger (2002) argued that educational philosophy has had an influence on how the ZPD has been perceived in relation to foreign-language (FL) education. Overall, her perspective is that the ZPD belongs to progressive forms of education with its emphasis on emergent learning and varying pathways to the same goal dependent on individual differences in development and as pertains to potential development. However, she is also wary of what she believes are overextensions of the ZPD, particularly as related to learning on its own.

Over the years, unfortunately, a number of students and their instructors have conflated the ZPD with Krashen's (1982) input hypothesis. Dunn and Lantolf (1998) bring clarity to this issue. As should be established at this point, Vygotsky focused on the intermental as leading to the intramental as a basic grounding of the ZPD. As the authors point out,

Krashen's $i + 1$ theory, on the other hand, only addresses intramental processing as an aspect of Chomsky's universal grammar, which is not associated with interaction *per se*, but rather is a function of the brain with regard to input processing only.

L2 Dynamic Assessment

Dynamic assessment can be quantitative, qualitative, or both. The quantitative approach, as suggested above, stems from Vygotsky's work on intelligence testing and typically takes a pretest, intervention, posttest assessment, in which all participants receive the same intervention as a group. Kozulin and Garb (2002) conducted just such an assessment on FL reading comprehension, electing to provide a group intervention after a pretest that focused on learning how to access meaning through the use of strategies. A numerical score was identified for each student, and the researchers used these scores to divide students into three groups—low, moderate, and high performers—as well as to make instructional recommendations.

The other common form of dynamic assessment, the "interactionist" approach, is more "interpretive," not relying on numerical scores exclusively, but instead on the quality of interaction with the individual. Anton (2003) engaged this form of dynamic assessment for FL-program placement purposes. She analyzed student responses during an oral interview in which each student was given a chance to make corrections, the teacher providing prompts. As expected from the standpoint of the ZPD, some students appeared to be at the same level of oral proficiency until they interacted with the teacher, at which point their potential could be assessed, allowing a more informed decision as to which FL course would serve them best.

Aljaafreh and Lantolf (1994), in another study that follows this pattern, used a scripted set of hints leading from less to more explicit feedback while interacting with individual students within the confines of this mediational scale. The focus of the study was on a teacher working with students in correcting their writing across multiple meetings. This approach to assessment/instruction proved effective from the standpoint of determining ZPDs—some students only required minimal intervention (some actually were able to make corrections with mere proximity to the instructor while waiting their turn), while others needed a great deal more explicit assistance to effectively come to understand a specific problem. However, as Poehner (2008, p. 54) points out with regard to this study, without true reciprocation—by following a rubric of hints—mediation is limited because "the degree of explicitness of each mediating move they contain is not absolute [because] [t]he significance of reciprocating and mediating moves is tied to the context in which they appear."

Moreover, Poehner (2008, p. 52), working on grammatical concepts in relation to FL learning, suggests that *a priori* scripted mediation, and particularly the kind found in Kozulin and Garb (2002), ignores the interactive style and potential of the learner (this study did not include a microgenetic analysis). Poehner (2008) concentrates on "learner reciprocity," bringing attention to five different ways in which learners responded to his position as mediator in their efforts to talk about two movie clips they had seen, and how this has much to do with creating ZPDs. Students were found to (a) take somewhat of an active role in the mediation, but rely on the instructor to negotiate the process; (b) use the mediator when seeking help; (c) take a more proactive role, creating opportunities to engage in learning/development; (d) continually seek approval from the instructor; and (e) provide no opportunity for mediation from the instructor (no ZPD was allowed to develop).

There have been other studies that have taken an interactionist perspective as well. Ableeva (2008) focused on listening comprehension, in which cultural background came

into play as critical to comprehension. Also, although no mention of dynamic assessment is ever made, the parameters for Washburn's (1994) study are highly akin to the interactionist view of this form of assessment. Washburn examined fossilization, hypothesizing that use of the ZPD would allow her to test whether or not L2 speakers are in fact fossilized, her assumption being that, if potential development is still possible outside actual development, then fossilization might not be a stable feature of the person's L2 development. Fossilized learners were only able to improve with direct explicit modeling, and they were unable to modify their output on the basis of linguistic clues alone; nonetheless, this finding indicates that development was still possible.

L2 Studies of the ZPD as a Broader Aspect of Sociogenesis Within Vygotskian Theory as a Whole

Nassaji and Swain (2000) drew on Aljaafreh and Lantolf (1994) in a study that followed an experimental design in which two intermediate-level ESL students were given different treatments with regard to working on article usage for written assignments. The 12 hints of the regulatory scale developed by Aljaafreh and Lantolf were used with each of the students, although one student was given feedback on the correct basis—moving from more implicit hints to more explicit ones if needed—and the other was given the hints in a random fashion without regard to where she was in the ZPD. Results showed a dramatic difference in improvement for the ZPD student as compared to the non-ZPD student across four 40-minute sessions for both qualitative and quantitative analyses (through the use of assessment instruments for the latter dimension).

Lantolf and Aljaafreh (1995, p. 621) extended their 1994 study, this time analyzing the protocols of two participants from the original study for regression, citing that “development does not proceed smoothly from state to state; rather it is conceptualized as a formation that ‘contains a number of developmental layers’ similar to the various strata preserved in the earth’s geological record” (Vygotsky, 1987, p. 140). Moreover, they argue that regression plays a part in the revolutionary reorganization of functional systems that is part of learning and the ZPD. They suggest such an analysis has important implications for theories of second language acquisition (SLA) that view interlanguage development as a stage-by-stage process.

Another area of concentration has been the more collective function of the ZPD as noted by Vygotsky in *Mind in Society* (see above). This work has focused on how peers (not only those more capable) help each other co-construct ZPDs. Donato (1994) concentrated on peers helping peers with a collective sense of the ZPD with regard to the related concept of scaffolding. He criticized the conduit metaphor (that information is simply passed back and forth, obscuring the interpersonal dynamics [contexts] as part of the process of meaning making) as a commonly held position by a number of SLA theorists. The focus of the study was on how “social interactions in the classroom result in appropriation of linguistic knowledge by the individual” (1994, p. 39), and data were collected for a one-hour planning session for a group of FL students in a classroom. Results showed how the students in the group scaffolded each other in the L2 while co-constructing their planning, and that this led to the appropriation of each other's L2 language forms; 32 examples of linguistic help were documented, and of these 24 were later found to be used by individuals independently.

Also, following Aljaafreh and Lantolf (1994) in relation to the L2 developmental levels they suggest, Ohta (2000) conducted a study that focused on how a more capable peer was able in interactions with the teacher to scaffold his fellow student, who was at a lower level of proficiency, to provide effective assistance in the ZPD. Ohta paid close attention to how the two students interacted during three different tasks, transcribing prosody as well as other phonological features as a part of assistance, and providing an exact record

of the “before and after” mistakes that the less proficient student was able to correct, although it is also important to point out that the more advanced student benefited from the interaction as well. Ohta invokes Vygotsky’s law of cultural development and the genetic law of development as well as the ZPD, finding that they go hand in hand, something she also claims in Ohta (2001). Additionally, Ohta (2001, p. 9) offers her own definition of the ZPD in relation to language learning: “For the L2 learner, the ZPD is the distance between the actual developmental level as determined by individual linguistic production, and the level of potential development as determined through language produced collaboratively with a teacher or peer.”

Vygotsky (1978, p. 102) tied play directly to the ZPD (see above), and this element of investigation has also found its way into the L2 ZPD literature. Lantolf (1997) undertook a study focusing on the use of language play in the form of private speech, the author noting that this allowed FL learners to concentrate on language meaning and form as a significant aspect of their L2 development. Importantly, some of the evidence for this came from examples where a student was imitating others in the environment. Another take on play stems from Newman and Holzman (1993), who suggest that play in the form of performance (i.e., making new roles for ourselves through imitation, in much the same way as illustrated by Vygotsky when he talks of children putting on their parents’ clothing and pretending to be them) is also critical to development as a whole. The concern of L2 studies in this domain has been learners taking on new aspects of being and becoming semiotically as related to identity when communicating in the L2 as a part of L2 development.

McCafferty (2002) undertook the study of an ESL college student interacting in a quasi-tutorial setting with an adult native speaker of American English, also a former EFL instructor, over two time periods for a total of 15 sessions. The study focused on the gestures that the two participants employed as an aspect of meaning making. It was found that gesture helped both participants with lexical comprehension, that the two participants often imitated each other’s gestures, and that gestures operated as a focal point for organizing discourse. In another similar study, Haught and McCafferty (2008) examined the gestures of classroom participants in a volunteer drama ESL class for a semester in which the students read though scripts multiple times out loud, taking different parts at different times. The instructor also participated and inadvertently gestured while taking different parts. Over time the students began to mirror his gestures and only his gestures. In this study the participants performed themselves as insiders of the L2 languaculture, in a sense “trying on” a different and embodied semiotic identity through imitation.

Moreover, in what seems to be the only L2 child study within an applied linguistics frame, Da Silva Iddings and McCafferty (2005) also focused on play, and furthermore took a collective view of peer interaction as leading to learning and development within the ZPD. The authors found that two third-grade ESL students, one a Brazilian Portuguese speaker and the other a Spanish speaker, when asked to interact concerning a picture book on spiders, shifted to an imaginary plane of activity, calling the tarantula they were looking at “Snow White” (Vygotsky uses the term “pivot” in relation to an object that is taken for something it is not in play). Each used the other’s L1 (no English was spoken), a form of language play. Also, the Brazilian student overlay her Portuguese with what she perceived as Spanish intonation patterns. The authors concluded that upon entering each other’s linguistic world, the two children were both using and inventing sign at the same time and perhaps gaining insights into the very nature of sign/symbol relationships.

In conclusion, although I have followed the conventional treatment of the ZPD as a “place” (what is “in” the zone), I in fact agree with Newman and Holzman (1993) that the ZPD is not a container at all, but instead is manifested through activity, despite the spatial metaphor. Also, all of the literature depicted above for the L2 application of the ZPD as found in *Thinking and Speech* and *Mind in Society* has shone a light on various issues within

applied linguistics, including: L2 acquisition versus development, corrective feedback, regression, identity, gesture studies, assessment, drama (play), pragmatics, fossilization, imitation, metalinguistic knowledge/awareness, language play, and related pedagogical applications. There seem to be a host of conceivable studies that would further the understanding of these and other aspects of applied linguistics, and further study of the ZPD can only enhance our knowledge of L2 learning/teaching/assessment.
